# Needle Roller Bearings

CAT. NO. 2300-VI/E

	Technical Data	A- 1~ 58
	Needle roller and cage assemblies	B- 3~ 20
	Needle roller and cage assemblies for connecting rod bearings	B- 21~ 28
	Drawn cup needle roller bearings	B- 29~ 52
	Machined-ring needle roller bearings	B- 53~ 96
	Machined-ring needle roller bearings, separable	B- 97~114
	Inner rings	B-115~132
	Clearance-adjustable needle roller bearings	B-133~138
	Complex bearings	B-139~160
	Roller followers	B-161~173
	Cam followers	B-174~204
	Thrust roller bearings	B-205~220
	Components Needle rollers / Snap rings / Seals	B-221~234
	Linear bearings	B-235~254
	One-way clutches	B-255~259
	Bottom roller bearings for textile machinery Tension pulleys for textile machinery	B-260~266
	Appendixes	C- 1~ 20

## Warranty

NTN warrants, to the original purchaser only, that the delivered product which is the subject of this sale (a) will conform to drawings and specifications mutually established in writing as applicable to the contract, and (b) be free from defects in material or fabrication. The duration of this warranty is one year from date of delivery. If the buyer discovers within this period a failure of the product to conform to drawings or specifications, or a defect in material or fabrication, it must promptly notify NTN in writing. In no event shall such notification be received by NTN later than 13 months from the date of delivery. Within a reasonable time after such notification, NTN will, at its option, (a) correct any failure of the product to conform to drawings, specifications or any defect in material or workmanship, with either replacement or repair of the product, or (b) refund, in part or in whole, the purchase price. Such replacement and repair, excluding charges for labor, is at NTN's expense. All warranty service will be performed at service centers designated by NTN. These remedies are the purchaser's exclusive remedies for breach of warranty.

NTN does not warrant (a) any product, components or parts not manufactured by NTN, (b) defects caused by failure to provide a suitable installation environment for the product, (c) damage caused by use of the product for purposes other than those for which it was designed, (d) damage caused by disasters such as fire, flood, wind, and lightning, (e) damage caused by unauthorized attachments or modification, (f) damage during shipment, or (g) any other abuse or misuse by the purchaser.

**THE FOREGOING WARRANTIES ARE IN LIEU OF ALL OTHER WARRANTIES, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.**

In no case shall NTN be liable for any special, incidental, or consequential damages based upon breach of warranty, breach of contract, negligence, strict tort, or any other legal theory, and in no case shall total liability of NTN exceed the purchase price of the part upon which such liability is based. Such damages include, but are not limited to, loss of profits, loss of savings or revenue, loss of use of the product or any associated equipment, cost of capital, cost of any substitute equipment, facilities or services, downtime, the claims of third parties including customers, and injury to property. Some states do not allow limits on warranties, or on remedies for breach in certain transactions. In such states, the limits in this paragraph and in paragraph (2) shall apply to the extent allowable under case law and statutes in such states.

Any action for breach of warranty or any other legal theory must be commenced within 15 months following delivery of the goods.

Unless modified in a writing signed by both parties, this agreement is understood to be the complete and exclusive agreement between the parties, superceding all prior agreements, oral or written, and all other communications between the parties relating to the subject matter of this agreement. No employee of NTN or any other party is authorized to make any warranty in addition to those made in this agreement.

This agreement allocates the risks of product failure between NTN and the purchaser. This allocation is recognized by both parties and is reflected in the price of the goods. The purchaser acknowledges that it has read this agreement, understands it, and is bound by its terms.

## 1. Classification and Characteristics Bearings

Needle roller bearings have relatively smaller diameter cylindrical rolling elements whose length is much larger than their diameter.

Compared with other types of rolling bearings, needle roller bearings have a small cross-sectional height and significant load-bearing capacity and rigidity relative to

their volume. Also, because the inertial force action on them is limited, they are ideal choice for oscillating motion. Needle roller bearings contribute to compact and lightweight machine designs. They serve also as a ready replacement for sliding bearings.

NTN offers the following types of needle roller bearings.

### Needle roller and cage assembly

This assembly, a major component of a needle roller bearing, comprises needle rollers and a cage to support the rollers.

- Using the shaft and housing as raceway surfaces reduces the cross-sectional height: it is equal to the diameter of the needle roller bearing.
- This structure eliminating the outer and inner rings allows the bearing to be fitted more easily.
- The assembly is available in both single-row and double-row configurations.
- As long as the tolerance limit of the shaft and housing is satisfied, the radial internal clearance can be made adjustable.

### Needle roller and cage assembly for connecting rods

This assembly, a major component of a needle roller bearing, comprising needle rollers and a cage to support the rollers, is used typically for connecting rods in reciprocating compressors and small- and mid-sized internal combustion engines such as those for motorbikes, light cars, outboard motors and versatile engines. This assembly features such a cage that is specifically optimized for severe operating conditions involving high impact loads, complicated motions, high-speed revolution and/or high operating temperatures.

### Needle roller and cage assembly for large end

- This assembly, subjected to a cranking motion with a simultaneous action of the rolling elements' rotation and revolution, must be light but have a high rigidity, and must have a precise dimension of the outer diameter of the cage so that the guiding system can keep an appropriate gap.
- The cage is made of high-tensile special steel with a surface hardening treatment.
- The guiding system employed is an outer diameter guiding system.
- The cage that may be subjected to poor lubrication can be protected with a surface treatment using a non-ferrous metal.
- For applications with a one-piece structure of crank shaft, the cage of split type is also available.

## Needle roller and cage assembly for small end

- Strong impact load acts on this bearing and it oscillates at high speed. Therefore, the cage bore surface is finished with high precision so as to secure lightweight, high rigidity and proper guide clearance.
- The cage is made of high tensile special steel and its surface is hardened ideally.
- The cage is of bore guide type and the guide surface is designed as long as possible to thereby reduce the surface pressure.
- The roller length is designed to the possible maximum value against the connecting width and a number of small-size needle rollers are fitted in the cage to minimize the contact pressure.

## Drawn-cup needle roller bearing

This bearing comprises an outer ring and needle rollers, which were both drawn from special thin steel plate by precision deep drawing, and a cage intended to guide precisely the needle rollers.

- This bearing is the type of the lowest section height, of the rolling bearings with outer ring, best-suited to space-saving design.
- A hardened and ground shaft or inner ring (IR Series) is used as the raceway.
- This bearing needs no axial locking due to easy installation and press-fit in the housing.
- The close end type to close shaft end is available in addition to the open end type.
- Furthermore, the type with seal fitted in at single side or double sides is also available.
- The standard type comprises a needle roller and cage assembly. In addition to this type, special type comprising full complement rollers is available at option.

## Machined-ring needle roller bearings

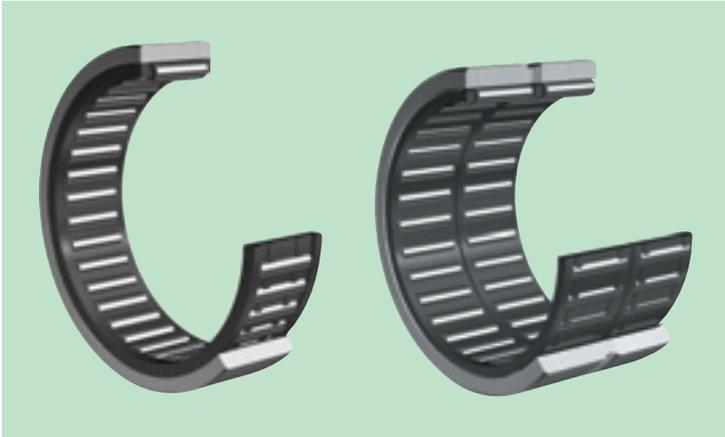

This bearing type comprises a machined outer ring and machined needle rollers, and a cage to guide properly the needle rollers.

In the case of this bearing, the cage or the needle rollers are guided by the ribs of the outer ring or the face ring. Hence, this bearing is non-separable type. In addition, the type with no inner ring is also available for enabling a shaft to be used as the raceway surface. (Of course, the type with inner ring is available.)

- Selectively available for both of the metric system and the inch system.
- Best-suited to space-saving design due to its low section height, then having the large load capacity.
- High rigidity and high bearing accuracy due to its machined (precut) outer ring
- can be used with a housing made of light metal, etc. due to its outer ring of high rigidity.
- Outer ring with lubrication hole and lubrication groove
- Single row and double row types available.
- The type with seal fitted in at single side or double sides is also available.

## Machined-ring needle roller bearing separable type

This bearing type comprises a machined outer ring and machined needle rollers, and a cage to guide and retain properly the needle rollers. And the needle roller and cage assembly is separable from the outer ring. In addition to the standard type, the type with no inner ring is also available for enabling a shaft to be used as direct raceway surface. (Of course, the type with inner ring available, too.)

- Easy to install, — the needle roller and cage assembly, the outer ring, and the inner ring can be mounted independently from each other.
- Any optional radial internal clearance is selectable by combining the individual independent components.
- Best-suited to space-saving design due to its low section height, then having the large load capacity.
- High rigidity and high bearing accuracy due to its machined (precut) outer ring.
- Can be used with a housing made of light metal, etc. due to its outer ring of high rigidity.
- Single row and double row types available. And the outer ring of the double row bearing is provided with lubrication hole and lubrication groove.

## Inner ring

For the needle roller bearings, usually a shaft is used as the raceway surface, but this inner ring is used where the shaft surface can not be machined to the specific hardness and roughness. This inner ring is suited to space-saving design due to its low section height. This is made of high carbon chrome bearing steel, finished by high precision grinding after heat-treated.

- Can also be used as a bush.
- Selectively available for both of the metric system and the inch system.
- The type with lubrication hole at the raceway center also available.

## Clearance-adjustable needle roller bearing

This bearing type comprises a machined outer ring and machined needle rollers, and a cage to guide and retain properly the needle rollers, but the needle roller and cage assembly is non-separable from the outer ring. In addition to the standard type, the type with no inner ring is also available for enabling a shaft to be used as direct raceway surface. (Of course, the type with inner ring available, too.)

- The raceway diameter of the outer ring is shrunk by pressing the outer ring in axial direction, which then enables to reduce the roller set bore diameter correspondingly.
- Radial clearance is finely adjustable by adjusting axial pressing load and thereby changing shrinkage of the outer ring raceway diameter.
- This bearing is applied to the work spindle of a machine tool and other similar portions which require the high speed rotational accuracy of JIS Grade-4.

## Thrust roller bearing

This bearing comprises needle rollers or cylindrical rollers, a cage to guide and retain properly the rollers, and disc-shaped rolling bearing ring. This is a bearing capable of supporting one-way axial load. Furthermore, this bearing can be used without rolling bearing ring, where the heat-treated and ground bearing mount surface can be used as the raceway surface.

- Best-suited to space-saving design due to its small section height, then having the large load capacity.
- Available are AS type rolling bearing ring made of thin steel plate with hardened surface and WS type and GS type machined rings.

## Complex needle roller bearings — Needle roller bearing with thrust bearing —

This complex bearing comprises a radial needle roller bearing for supporting radial load and a thrust bearing for supporting axial load which are assembled integrally. Both thrust ball bearing type and thrust axial roller bearing type are available as the bearing intended to support axial load.

- The thrust bearing with dust-proof cover is also available, which has a good effect in preventing scattering of oil and grease and invasion of external dust, etc.

## Complex needle roller bearings

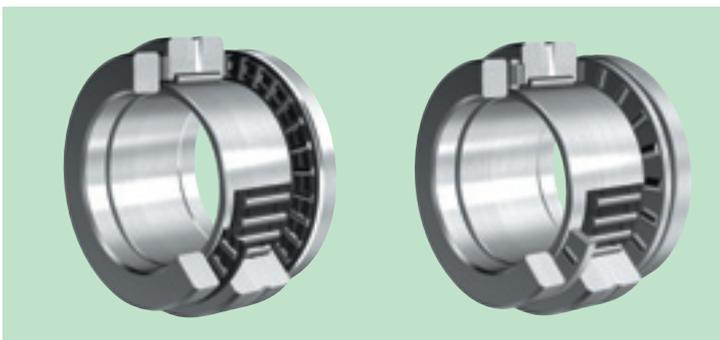

### — Needle roller bearing with angular ball bearing, needle roller bearing with three-point contact ball bearing —

This complex bearing comprises a radial needle roller bearing for supporting radial load, a ball bearing for supporting comparatively small axial load and a machined inner ring which are all assembled integrally. Both angular ball bearing and three-point contact ball bearing are available as the ball bearing intended to support axial load.

- The complex needle roller bearings (NKIA Series) using an angular ball bearing as the thrust bearing can support one-directional angular load.
- The complex needle roller bearings (NKIB Series) using a three-point contact ball bearing as the thrust bearing can support double-directional axial load and furthermore its position in axial direction can be fixed, too.

## Needle roller bearing with double thrust roller bearing

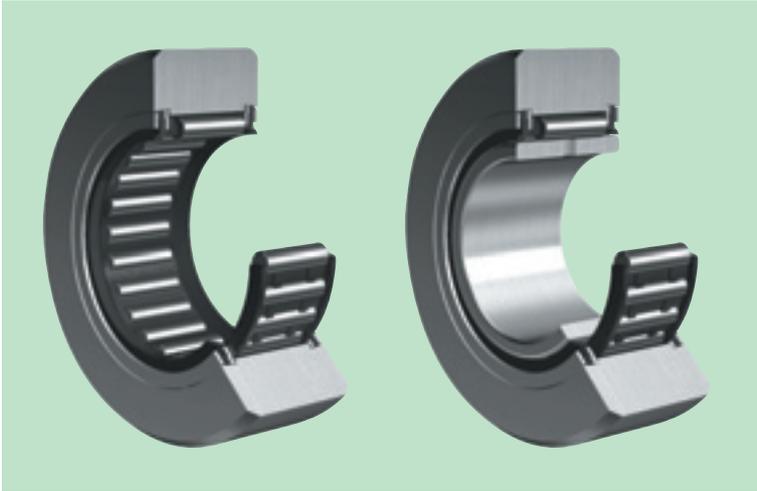

This is a complex bearing wherein a thrust needle roller bearing or a thrust cylindrical roller bearing intended to support axial load is configured at the double sides of a radial needle roller bearing for supporting radial load.

- Can support large axial load acting thereon from the double sides.
- Used as the bearing (precision bearing) for supporting the ball screw of a machine tool.

The track roller bearing is a needle roller bearing with thick outer ring, which is applied to cam roller, guide roller, eccentric roller and rocker arm.

The track roller bearings are mainly categorized into a yoke type track roller bearing (roller follower) and a stud type track roller bearing (cam follower). Various types of the roller follower and the cam follower are available as described hereunder.

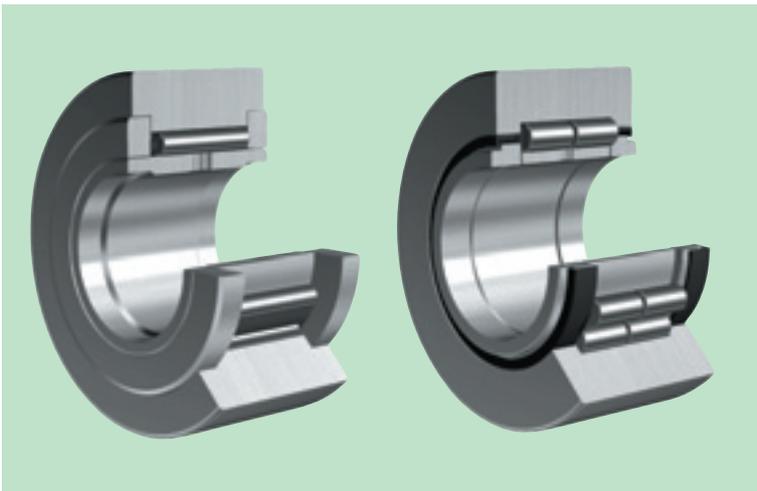

## Roller follower — Without axial guide —

This roller follower is a bearing designed for rotation of the outer ring wherein a needle roller and cage assembly and a synthetic rubber seal reinforced with steel plate are assembled in the thick-walled outer ring.

- The outer ring, the needle roller and cage assembly, and the rubber seal are non-separable from each other.
- The outer ring is thick-walled type so that it is resistible to high load and impact load.
- The shaft must be provided with a thrust washer and a flange, because of the outer ring with no ribs (or face ring) and no axial guide function.
- The outer surface is available in both spherical (crowning) profile and cylindrical profile.
- The bearing with spherical outer ring is effective in damping bias load which is caused by deviation in installing.
- The bearing with cylindrical outer ring is suitable to the cases of large load and low-hardness track surface, due to its large area of contact with the mating track surface.

## Roller follower — With axial guide —

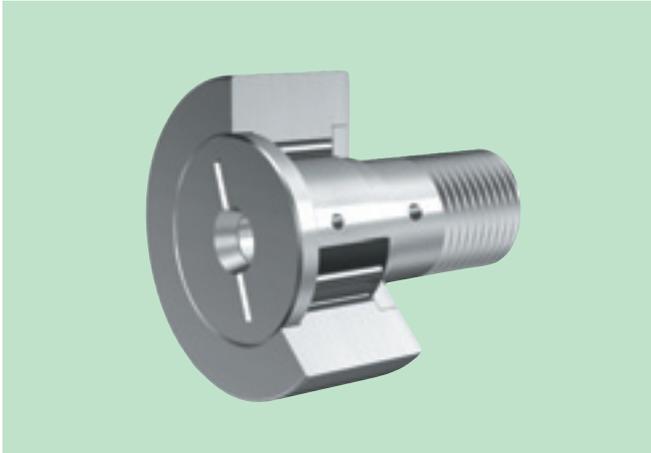

This roller follower is a bearing designed for rotation of the outer ring wherein a needle roller and cage assembly, an inner ring, and a face ring are assembled in the thick-walled outer ring.

This bearing uses needle rollers as its rolling element and furthermore classified into bearing with cage and full complement roller bearing without cage. The outer ring is guided axially by a face ring which is press-fitted in the inner ring.

- The outer ring is thick-walled type so that it is resistible to high load and impact load.
- The outer surface is available in both spherical (crowning) profile and cylindrical profile.
- The bearing with spherical outer ring is effective in damping bias load which is caused by deviation in installing.
- The bearing with cylindrical outer ring is suitable to the cases of large load and low-hardness track surface, due to its large area of contact with the mating track surface.
- This bearing is easier to handle because it needs no mounting of a guide (thrust washer, etc.) on the shaft unlike other types without axial guide (RNA22, NA22).

## Cam follower — Needle roller type —

This is a bearing designed for rotation of the outer ring in which a needle roller and cage assembly and a stud in lieu of inner ring are fitted in the thick-walled outer ring. The stud is so threaded as to be mounted easily. This cam follower (bearing) uses needle rollers as its rolling element and it is further classified into one bearing type with cage and another full complement roller bearing type without cage.

- The bearing type with cage is suitable to comparatively high speed running because its rollers are guided by the cage.
- The full complement roller type enabling to use more needle rollers than the type with cage has large load capacity.
- The outer surface is available in both spherical (crowning) profile and cylindrical profile.
- This cam follower (bearing) is selectively available for both of the metric system and the inch system.
- Furthermore, the seal built-in type is also available.
- The stud is of either recessed head type allowing use of a screwdriver or hexagon socket head type so as to be mounted and adjusted easily.

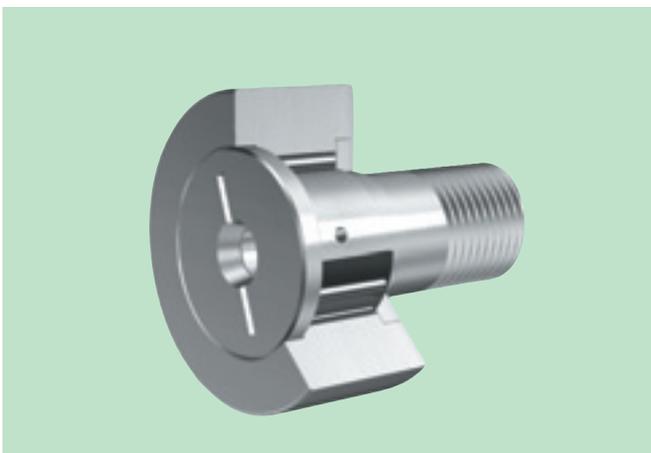

## Cam follower — Cylindrical roller type —

This is a full complement roller bearing designed for rotation of the outer ring in which double-row cylindrical rollers and a stud in lieu of inner ring are fitted in the thick-walled outer ring. The stud is so threaded as to be mounted easily.

- This cam follower (bearing) has the radial /axial load capacity larger than the needle roller type.
- A steel plate is press-fitted in the outer ring and a labyrinth seal is formed between the face ring and the outer ring.
- The outer surface is available in both spherical (crowning) profile and cylindrical profile.
- The stud is of either recessed head type allowing use of a screwdriver or of hexagon socket head type so as to be mounted and adjusted easily.

## Cam follower — Eccentric type —

This is a cam follower (bearing) wherein the studs of the needle roller type and cylindrical roller type prescribed above were made eccentric, which can then be adjusted by making eccentric the outer ring relative position against the raceway.

- Load distribution is easily adjustable in configuring two or more cam followers in linear form.
- Preload can be applied by adjustment of load distribution.
- Alignment is possible even when the mounting hole is not processed in high accuracy.
- The outer surface is selectively available in both spherical (crowning) profile and cylindrical profile.
- The stud is of either recessed head type allowing use of a screwdriver or hexagon socket head type so as to be mounted and adjusted easily.

The components described hereunder are for needle roller bearing.

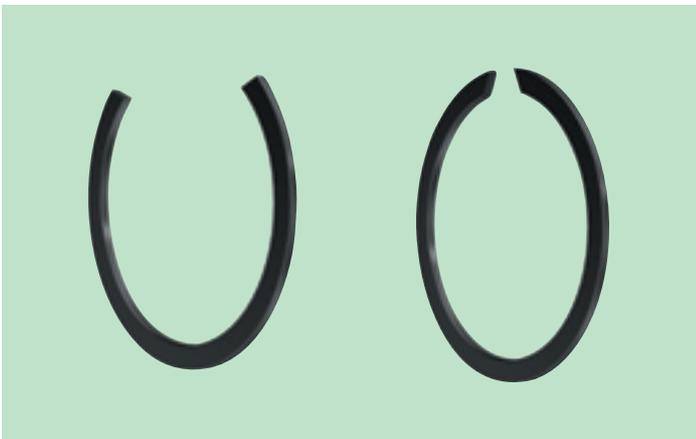

## Needle rollers

The needle rollers with flat end face and round end face are standard. These rollers are made of high-carbon chrome bearing steel, surface-finished by grinding and buffing after heat-treated. The standard accuracy of these rollers is "Precision Grade".

- A-Inter-diameter tolerance of the needle rollers is 2mm maximum.
- The roller type with crowned rolling surface is also available, which can damp edge load.
- These needle rollers are supplied as an individual for applications (pin, shaft) other than rolling element.

## Snap rings

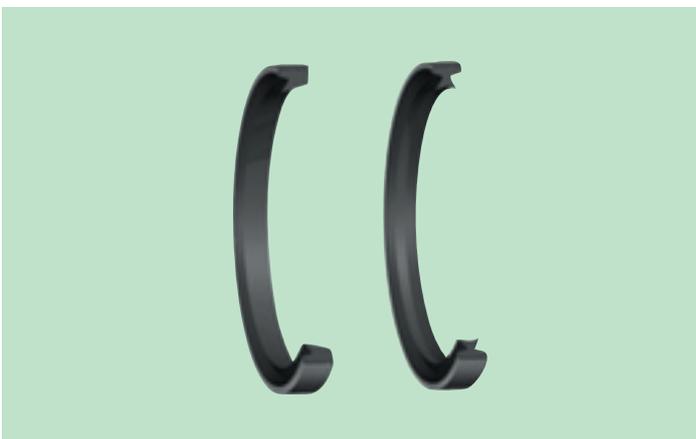

These are special-purposed rings used for axially positioning or guiding the inner and outer rings or the needle roller and cage assembly in needle roller bearing.

The ring material is a hard steel wire rod and chemical conversion treatment is applied to its surface so as to provide high rigidity.

- Two types are available for shaft and housing use.
- The section height is lowered flexibly according to the dimensions of needle roller bearings. In addition, manufacture of these rings is available up to the possible minimum dimensional range.
- For the axial guide it is recommended to provide a spacer between the cage and the snap ring.

## Seals

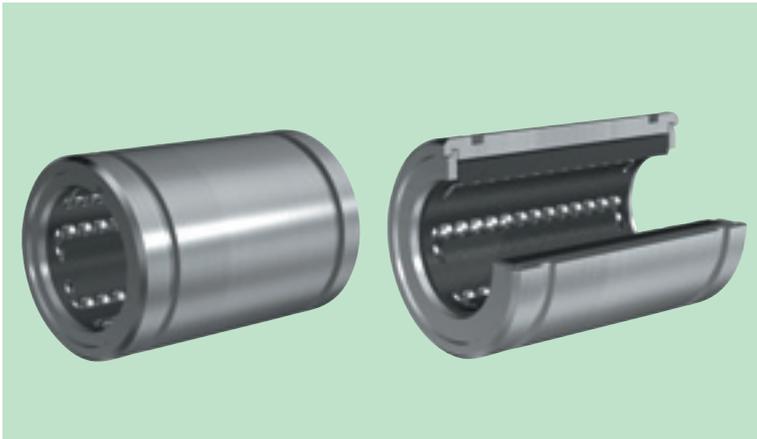

This is a special-purposed seal which was designed so as to match the small section height of needle roller bearings.

- G-type seal with one lip and GD-type seal with two lips are selectively available on application.
- These seals comprising steel ring and synthetic rubber can be used at the operating temperature ranging from -25 to 120°C, but continuous use thereof is subject to 100°C and less.
- These seals act to prevent invasion of external foreign matter and over-consumption of lubrication grease.
- The radial section height of each seal is designed so as to match the drawn-cup needle roller bearings. Hence, these seals require no additional finishing of the housing. This facilitates handling.

This catalogue describes the following ones of linear motion bearings.

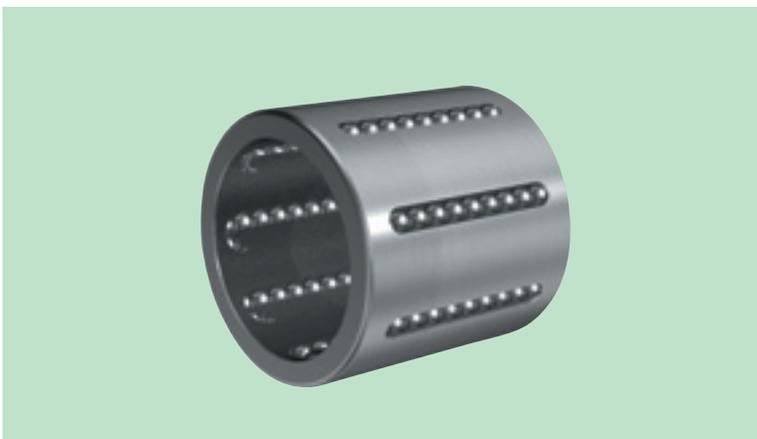

## Linear ball bearing — Machined ring type —

This is a high precision bearing which comprises a machined outer ring and face ring, steel balls and a synthetic resin cage for retaining the balls and rolls on a shaft, maintaining the endless linear motion.

- Standard type, clearance-adjustable type and open type are selectively available on application.
- Some bearings of these types are provided with a synthetic rubber seal at single side or double sides to prevent invasion of foreign matter therein.
- The steel balls are guided precisely by the cage so that stable linear motion can be achieved with less friction resistance.
- No rotational motion is available.

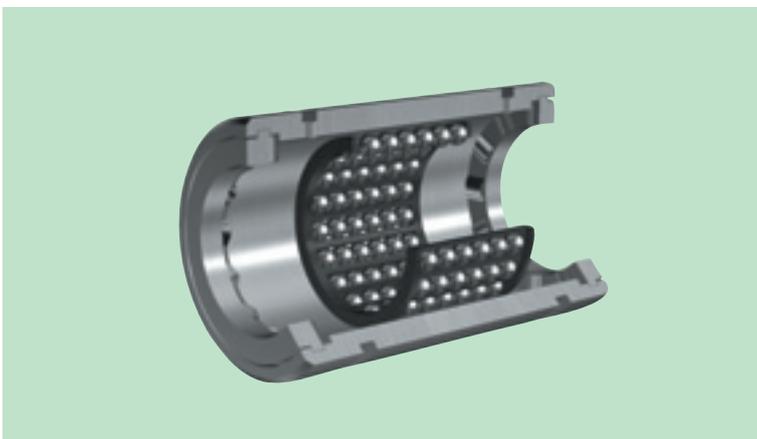

## Linear ball bearing — Drawn cup type —

This is a high precision bearing which comprises an outer ring drawn from thin special steel plate by precision deep drawing, steel balls and a synthetic resin cage for retaining the balls and rolls on a shaft, maintaining the endless linear motion.

- The outer ring made of thin steel plate enables to make less the section height and to design the linear motion system of compact structure.
- Easy to install — This bearing is press-fitted in the housing so that it requires no axial fixing.
- No rotational motion available.
- Some bearings of this type are provided with a synthetic rubber seal at double sides to prevent invasion of foreign matter therein.

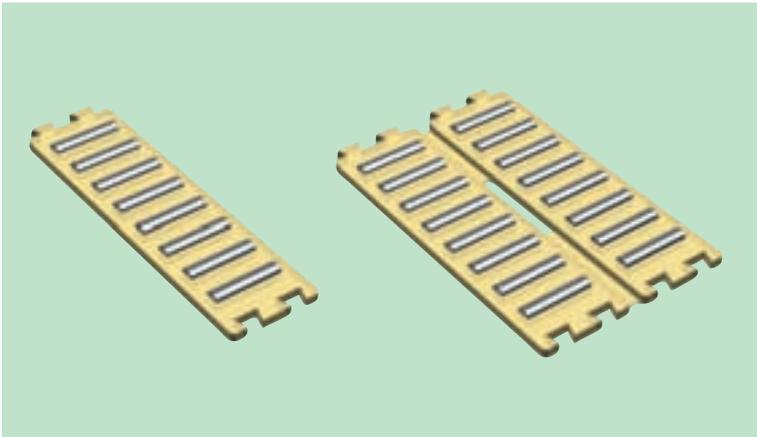

## Linear ball bearing — Stroking type —

This bearing comprises a machined outer ring and face ring, steel balls and a cage for retaining the balls and reciprocates finitely on a shaft as well as rotates on a shaft. The outer ring is provided with a snap ring as the cage stopper at its double sides and, furthermore, a wavy spring is provided between the snap ring and the cage to damp impact acting the cage and to thereby prevent wear of the cage.

- Some bearings of this stroking type are provided with a synthetic rubber seal at its double sides to prevent invasion of foreign matter therein.
- The outer ring is so grooved that snap ring can be fitted and fixed easily.

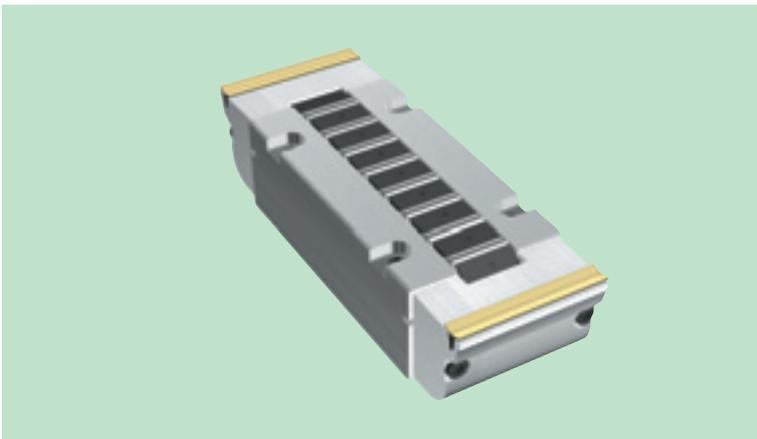

## Linear flat roller

This is a flat roller bearing which comprises a flat cage and needle rollers and reciprocates on a flat raceway in linear direction by motion of its linear movable components.

- The molded polyamide resin cage and press-formed steel plate cage are selectively available on application.
- FF type molded resin cage — Several cages can be used with them jointed with each other in parallel configuration.
- The press-formed steel plate cage — Cage to cage jointing is unavailable, but it can be supplied at any optional length.
- In the case of double-row resin cage, it is provided with an elastic joint at its center part so it can be reformed at any optional angle by dipping it in an oil of 70 to 90°C and can be mounted on a Vee-grooved surface.

## Linear roller bearing

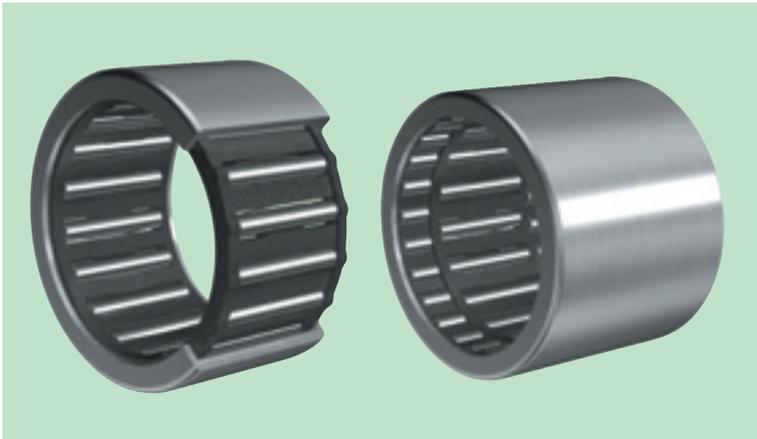

This bearing comprising cylindrical rollers capable of turning internally around the track frame moves endlessly on a flat surface in linear direction.

- Low friction factor due to the case assemblies preventing neighboring roller from touching.
- High load rating due to use of cylindrical rollers.

This catalogue describes the following products, too.

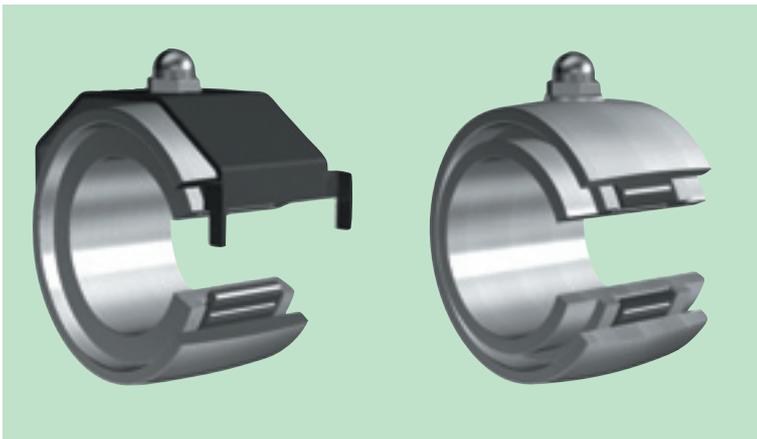

## One-way clutch

This one-way clutch comprises an outer ring drawn from thin special steel plate by precision deep drawing, spring, needle rollers and cage and can transmit a torque in only one way.

- Less friction torque against over-running, great transmission torque for small section height.
- Various types are available as follows; one-way clutch with bearing built therein to support radial load, one-way clutch with outer ring plated for improvement of erosion resistance, one-way clutch integrated with gear, pulley, etc.
- HF type and HFL type can be locked axially by being only press-fitted in the housing.
- These one-way clutches use the outer ring drawn by precision deep drawing, which needs the housing with wall thickness of a specified value or more.
- HF type is subjected to configuration of a radial ball bearing at its double ends. (On the other hand, HFL type is complete with radial bearings built-in at its double sides.)

## Bottom roller bearing — For textile machinery —

This is a grease pre-filled needle roller bearing intended to support the bottom rollers. The spherical outer surface of the outer ring can allow bottom roller mounting error to some extent. On the other hand, the inner ring is provided with ribs at its double ends. A clearance between the outer ring ribs and the inner ring ribs is kept less and, in addition, the outer surface of each inner ring rib is knurled so as not to allow easy invasion of mist, etc. into the bearing.

## Tension Pulley — For Textile Machinery —

This pulley is used to guide the tapered portion or belt of the spindle drive unit in each of a fine spinning machine, a rough spinning machine, a pre-twisting machine, etc. as well as to apply tension to them. The pulley drawn from steel plate by precision deep drawing is press-fitted on the outer ring of shaft bearing instead of inner ring.

## 2. Load Rating and Life

### 2.1 Bearing life

Even when bearings are in running under normal condition, the raceway surface and the surfaces of the rolling elements inevitably subjected to repetitive compression stress result in flaking due to fatigue of the raceway an element materials and can resist no longer to further running even under normal condition. "Bearing life" is defined as the total cumulative bearing revolutions until flaking occurs thus on the raceway surface or the element rolling surfaces.

Further use of bearings becomes unavailable, caused by various defects such as seizure, wear, crack, chipping, chattering, rusting, etc. in addition to the flaking phenomenon stated above. However, these phenomena should be deemed as defects of bearing itself and, therefore, be discriminated from bearing life. And the defect causes are such as incorrect selection of bearing, improper mounting, improper lubrication, imperfect sealing, etc. Hence, bearing trouble can be avoided by removing the said causes.

### 2.2 Basic rated life and basic dynamic load rating

Even when a group of same bearings have been in running under the same condition, considerably great variation is found among the individual bearing lives. This comes from variation in material fatigue itself. Hence, the basic rated life defined below considering statistically this variation in material fatigue is applied as the bearing life.

The basic rated life means the substantial total cumulative revolutions of the individual bearings 90% (90% reliability) of which can revolve without resulting in flaking due to rolling fatigue when a group of same bearings have been put individually in continuous running under same condition. When bearings have been in running in constant revolution, the basic rated life is expressed as the total cumulative revolutions of the individual bearings.

On the other hand, the basic dynamic load rating represents the load capacity of rolling bearing, then meaning a constant load under which the basic rated life of 1,000,000 revolutions is achieved. This constant load of radial bearing is expressed with net radial load, while that of thrust bearing is expressed with net axial load.

The bearing dimensions table in this catalogue describes the respective basic dynamic load ratings of the bearings that were manufactured using NTN's standard materials and manufacturing processes in current use.

For the respective basic rated lives of the bearings manufactured using the special materials and special manufacturing processes, feel free to contact NTN for inquiry.

The relationship among the basic rated life, the basic dynamic load rating and the axial load can be expressed in **formula (2.1)**.

Basic Rated Life specified in ISO 281.

$$L_{10} = \left( \frac{C}{P} \right)^p \dots\dots\dots(2.1)$$

where,

$p = 10/3$  .....For roller bearing  
 $p = 3$  .....For ball bearings

$L_{10}$  : Basic rated life ( $10^6$  revolutions)  
 $C$  : Basic dynamic rated load, (N) (kgf)  
 (radial bearings:  $C_r$ , thrust bearings:  $C_a$ )  
 $P$  : Bearing load, (N) (kgf)  
 (radial bearings:  $P_r$ , thrust bearings:  $P_a$ )

Furthermore, the basic rated life can be determined by **formula (2.2)**, where it is expressed in the operating hours.

$$L_{10h} = 500 f_n^p \dots\dots\dots(2.2)$$

$$f_n = f_n \frac{C}{P} \dots\dots\dots(2.3)$$

$$f_n = \left( \frac{33.3}{n} \right)^{1/p} \dots\dots\dots(2.4)$$

where,

$L_{10h}$  : Basic rated life, h  
 $f_n$  : Life factor  
 $f_n$  : Speed factor  
 $n$  : Rotational speed, r/min

The **formula (2.2)** can also expressed as **formula (2.5)**.

$$L_{10h} = \frac{10^6}{60n} \left( \frac{C}{P} \right)^p \dots\dots\dots(2.5)$$

Considering the life of either one, of several bearings installed in a machine or an equipment, until it breaks down due to rolling fatigue as the total bearing life as a whole, it can be determined by **formula (2.6)**.

$$L = \frac{1}{\left( \frac{1}{L_1^e} + \frac{1}{L_2^e} + \dots + \frac{1}{L_n^e} \right)^{1/e}} \dots\dots\dots(2.6)$$

where,

$e = 9/8$  .....For roller bearings  
 $e = 10/9$  .....For ball bearings  
 $L$  : Total basic rated life of bearing as a whole, h  
 $L_1, L_2 \dots L_n$  : Individual basic rated life of bearings, 1, 2, ..., n, h

### 2.3 Bearing-applied machines and requisite life

In selecting a bearing, it is essential to set up the requisite life of the bearing under the intended operating conditions, but the requisite life is mainly determined by the durability period and in-running reliability required for a machine to which the bearing is applied. In general, the requisite lifetime as a guideline is as shown in **Table 2.1**.

The fatigue life of bearing is an important factor to decide the bearing size to be applied. In addition to this factor, however, the strengths and rigidities of shaft and housing must be taken into consideration.

**Table 2.1 Operating conditions and requisite lifetime**

Operating conditions	Lifetime $L_{10h}$
Tools and devices requiring no all-time running Ex.) Door switcher, etc.	500
Machines which are operated for a short time or intermittently and do not cause comparatively great affect on others even if they shut down incidentally due to trouble. Ex.) Hand tools, heavy material handling hoist in a machining shop, general hand-operated machines, agricultural machines, crane in a casting shop, material automatic feeder, home appliances, etc.	4 000 ~ 8 000
Machines which are not put in continuous running but required to run very precisely Ex.) Auxiliary machines in a power station, conveyor in a flow process, elevator, general cargo handling crane, machine tool of low frequency in use, etc.	8 000 ~ 14 000
Machines which are operated for 8 hours per day but not put in all-time continuous running Ex.) Power generator in a factory, general geared unit, etc.	14 000 ~ 20 000
Machines which are operated for 8 hours per day Ex.) General machines in a machining shop, crane in all-time operation.	20 000 ~ 30 000
Machines which are put in 24-hour continuous running Ex.) Separator, compressor, pump, main shaft, table roller of rolling mill, conveyor roller, winding engine in a mine, driving motor in a factory, etc.	50 000 ~ 60 000
Machines which are put in 24-hour continuous running and, in addition, are not allowed absolutely trouble shutdown. Ex.) Cellulose manufacturing machine, paper making machine, power station, drainage pump in a mine, urban city water related equipment, etc.	100 000 ~ 200 000

## 2.4 Bearing life using the adjusted life rating factor

The basic bearing life rating (90% reliability) can be calculated using the formulas prescribed in Subsection 2.2, but on occasion the bearing life of over-90% reliability must be determined on application. Also, the bearing life can be further extended by using a specially improved bearing material and special manufacturing process/technique. Furthermore, it was clarified by the elastohydrodynamic lubrication theory that the bearing life would be influenced by bearing operating conditions (lubrication, temperature, speed, etc.)

The bearing life considering the above factors can be determined by **formula (2.7)** using "Life Adjustment Factor" specified in ISO 281.

$$L_{na} = a_1 \cdot a_2 \cdot a_3 (C/P)^p \dots\dots\dots (2.7)$$

where,

- $L_{na}$  : Adjusted life rating  $10^6$  revolutions
- $a_1$  : Reliability adjustment factor
- $a_2$  : Bearing material adjustment factor
- $a_3$  : Operating condition adjustment factor

### 2.4.1 Reliability adjustment factor $a_1$

The values of reliability adjustment factor  $a_1$  for 90% and higher reliability are as shown in **Table 2.2**.

### 2.4.2 Life adjustment factor for bearing material $a_2$

Where bearing material used is special type and quality and manufactured in the special process, the life-related bearing characteristics are inevitably variable depending on the specialties of the material. In such a case, the bearing life is adjusted using the life adjustment factor for bearing material  $a_2$ .

The basic dynamic load ratings described in "Bearing Dimensions Table" are subject to use of the standard

**Table 2.2 Values of reliability adjustment factor  $a_1$**

Reliability %	$L_n$	Reliability adjustment factor $a_1$
90	$L_{10}$	1.00
95	$L_5$	0.62
96	$L_4$	0.53
97	$L_3$	0.44
98	$L_2$	0.33
99	$L_1$	0.21

materials and manufacturing processes / techniques being used in NTN, and usually  $a_2=1$  rating is used.

Furthermore,  $a_2>1$  is eventually applied to the bearings manufactured using the specially improved material and manufacturing process / technique. In such a case, feel free to contact NTN for further instruction.

Where bearings made of high carbon chrome bearing steel are used at 120°C and over throughout a long term, the dimension of the normal heat-treated bearing varies significantly and, therefore, dimension-stabilizing heat-treatment (TS treatment) must be done to the bearings according to the maximum operating temperature. However, this dimension-stabilizing treatment causes the bearing hardness to reduce, finally an inverse affect on the bearing life. To avoid it, the bearing life is adjusted (compensated) by multiplying the life rating by the life adjustment factor for bearing material  $a_2$  shown in **Table 2.3**.

**Table 2.3 Values of life adjustment factor for bearing material  $a_2$  for dimension-stabilizing heat-treated (TS-treated) bearings**

Code	Maximum operating temperature	Life adjustment factor for bearing material $a_2$
TS2-	160°C	1.00
TS3-	200°C	0.73
TS4-	250°C	0.48

**2.4.3 Life adjustment factor for operating conditions  $a_3$**

The life adjustment factor for operating conditions  $a_3$  is used for adjustment (compensation) of the bearing life, where the lubricated bearing condition gets worse and the lubricant deteriorates or foreign matter is included in the bearing, caused by the rotational speed, temperature rise, etc. of the bearing in running.

Generally the life adjustment factor in the case of good lubricated bearing condition is  $a_3=1$  and, particularly where the lubricated bearing condition is good and other factors for the bearing are normal,  $a_3>1$  can be applied to adjustment of the bearing life. However,  $a_3<1$  is applied in the following cases.

• **Low viscosity of lubrication oil under bearing**

- temperature in running
- Radial needle roller bearing 13mm<sup>2</sup>/s and less
- Thrust needle roller bearing 20mm<sup>2</sup>/s and less

• **Particularly low rotational speed**

(The product of rotational speed  $n$  r/min by pitch circle diameter  $d_p$  mm of rolling element is  $d_p \cdot n < 10000$ .)

• **High operating temperature of bearing**

High operating temperature of bearing would cause the raceway hardness to reduce, whereby bearing life would be shortened. In such a case, the bearing life is adjusted (compensated) by multiplying the value shown in Fig.2.1 as the life adjustment factor for operating conditions depending on operating temperature.

• **Inclusion of foreign matter in lubricant**

In the case of special operating conditions, feel free to contact NTN for inquiry. For a bearing manufactured using the specially improved material and manufacturing process/technique, usually  $a_2 \times a_3 < 1$  is applied unless the lubricating condition is good, even though the life adjustment factor is  $a_2 > 1$ .

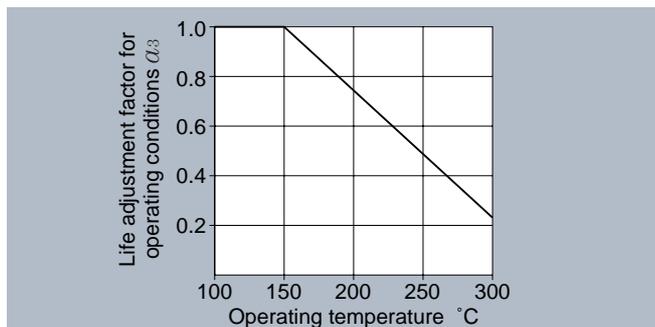

Fig. 2.1 Life adjustment factor for operating conditions depending on operating temperature

**2.5 Affect on basic dynamic load rating by raceway surface hardness**

When a bearing rolls on shaft surface/housing surface as its raceway surface, the surface layer must be hardened to HRC58 to 64 in proper hardening depth.

Ordinary quenching, carburizing or induction quenching, etc. are available as the raceway hardening method, but low hardness of the raceway would cause the bearing fatigue lifetime to reduce. In such a case, the basic load rating is adjusted by multiplying the hardness factor shown in Fig.2.2.

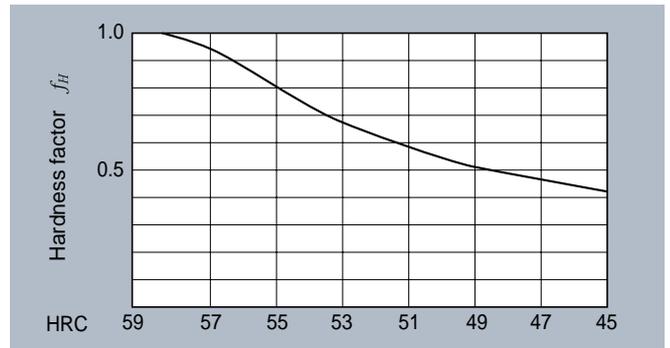

Fig. 2.2 Hardness factor

**2.6 Life of bearing with oscillating motion**

The life of bearing with oscillating motion can be determined by formula (2.8).

$$L_{osc} = \Omega L_{Rot} \dots \dots \dots (2.8)$$

where,

- $L_{osc}$  : Life of bearing with oscillating motion
- $L_{Rot}$  : Life rating subject to rotational speed r/min identical to oscillation frequency cpm
- $\Omega$  : Oscillation factor (showing the relation with half angle  $\beta$  of oscillation angle per Fig.2.3).

Generally Fig.2.3 is applied when the oscillation angle exceeds critical angle  $2\beta$ . This critical angle is nearly determined by design of bearing internals —mainly the number of rolling elements included in single row bearing.

Where a bearing with oscillating motion is used at below the critical angle, its life is shorter than the lifetime value calculated using Fig.2.3. When the critical angle is unknown, determine  $\Omega$ , assuming  $\beta = \beta_c$ . Feel free to contact NTN for inquiry about the critical angle of individual bearings.

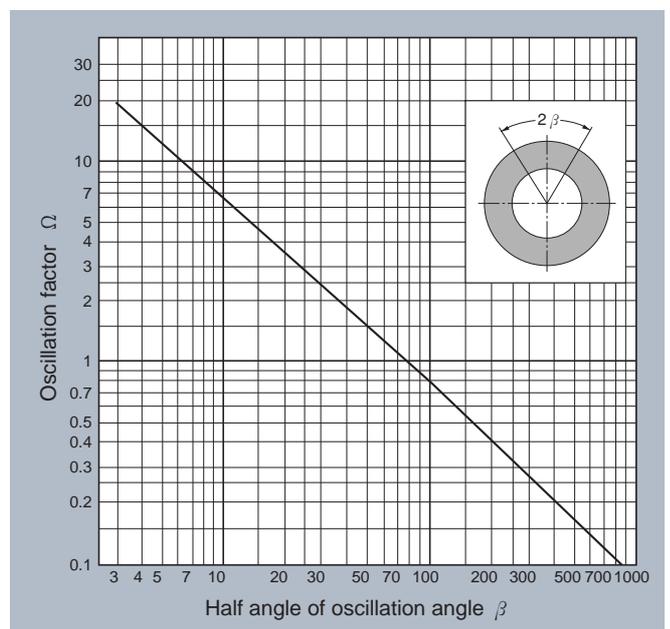

Fig. 2.3 Relationship of oscillation angle  $\beta$  to factor  $\Omega$

When the oscillation angle  $2\beta$  is very small, difficulty in forming an oil film on the contact surface of rolling ring to rolling element could result in fretting corrosion.

In the case of inner ring oscillation, the critical oscillation angle is expressed in **formula (2.9)**.

$$\text{Critical oscillation angle } \theta \geq \frac{360^\circ}{Z} \cdot \frac{d_p}{d_p - D_a \cos \alpha} \dots\dots(2.9)$$

- Where,  
 $Z$  : Number of rolling elements (per row)  
 $d_p$  : Pitch circle diameter (PCD) of rolling element  
 $D_p$  : Rolling element diameter  
 $e$  : Contact angle

(In the case of outer ring oscillation, the right side denominator is  $d_p + D_a \cos \alpha$ .)

**2.7 Life of bearing with linear motion**

In the case of bearings with linear motion such as linear ball bearing, linear flat roller bearing, etc., the relationship among axial travel distance, bearing load and load rating can be expressed in **formulas (2.10), (2.11)**.

When the rolling elements are balls;

$$L = 50 \times \left( \frac{C_r}{P_r} \right)^3 \dots\dots(2.10)$$

When the rolling elements are rollers;

$$L = 100 \times \left( \frac{C_r}{P_r} \right)^{10/3} \dots\dots(2.11)$$

- where,  
 $L$  : Load rating km  
 $C_r$  : Basic dynamic load rating N (kgf)  
 $P_r$  : Bearing load N (kgf)

**Fig.2.4** shows the relationship of  $C_r/P_r$  to  $L$ . Furthermore, when the travel motion cycle and travel distance remain unchanged, the lifetime of bearing can be determined by **formulas (2.12), (2.13)**.

When the rolling elements are balls;

$$L_h = \frac{50 \times 10^3}{60 \cdot S} \left( \frac{C_r}{P_r} \right)^3 \dots\dots(2.12)$$

When the rolling elements are rollers;

$$L_h = \frac{100 \times 10^3}{60 \cdot S} \left( \frac{C_r}{P_r} \right)^{10/3} \dots\dots(2.13)$$

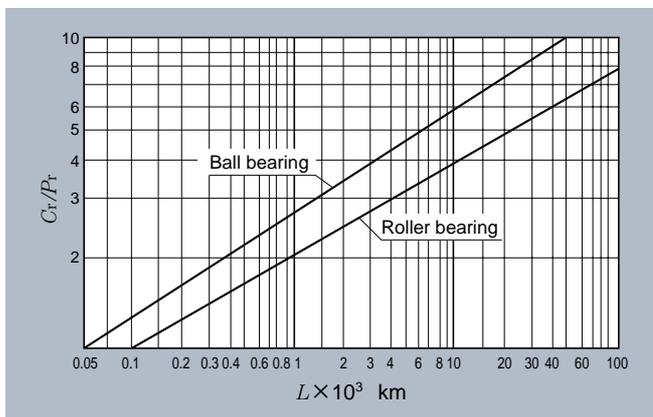

- where,  
 $L_h$ : Travel life h  
 $S$  : Travel distance per minute m/min  
 $S = 2 \cdot L \cdot n$   
 $L$  : Stroke length m  
 $n$  : Stroke cycle N (kgf)

**2.8 Various factors influencing bearing life**

Bearing life is influenced by not only bearing load and rotational speed but also various factors such as lubricating condition, internal clearance, surface roughness and hardness of raceway, heat-treated structure, misalignment, etc. In using bearings, therefore, these influence factors must be taken into full consideration. **Table 2.4** shows the bearing operating conditions as a guideline. (For the detail refer to "Commentary" described in Bearing Dimensions Table every each bearing type.)

**Table 2.4 Guideline of the bearing operating conditions**

Allowable rotational speed (r/min)	See Dimensions Table
Surface roughness of raceway	within 0.2a
Surface hardness of raceway	HRC58 to 64 Note: Refer to Subsection 7.5 for various materials and heat-treated hardness thereof.
Misalignment	1/2000 or less (for radial bearing)
Radial internal clearance	Ordinary level (C2, C3, C4)

**Fig. 2.4 Life of bearing with axial motion**

### 2.9 Fitting misalignment and crowning

Generally it is well known that stress concentration at edge portion (so called, edge load) arising from fitting misalignment would result in rapid reduction of bearing lifetime. "Crowning" is adopted as a countermeasure against such rapid reduction of bearing lifetime. In that case, however, unless it is designed properly this crowning would cause the effective contact length of roller to reduce, which could then lead to shorter life of bearing. It is therefore necessary to calculate a proper crowning value though depending on the extent of fitting misalignment.

And load condition. For reference, **Figs.2.5 to 2.7** show the examples of contact surface pressure analysis by a computer.

As seen from **Figs.2.5 to 2.7** (Examples of contact surface pressure analysis), the rollers with no crowning have high edge surface pressure, while the rollers with crowning restrain the edge surface pressure lower in the range of specific allowable fitting misalignment. **Fig.2.8** shows the relationship of allowable fitting misalignment to bearing lifetime. (example of computer analysis) It is possible to see from this Figure how the bearing lifetime is influenced by fitting misalignment.

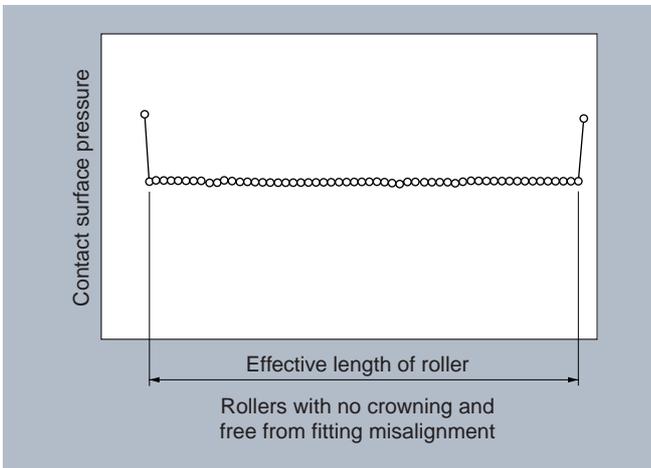

Fig. 2.5

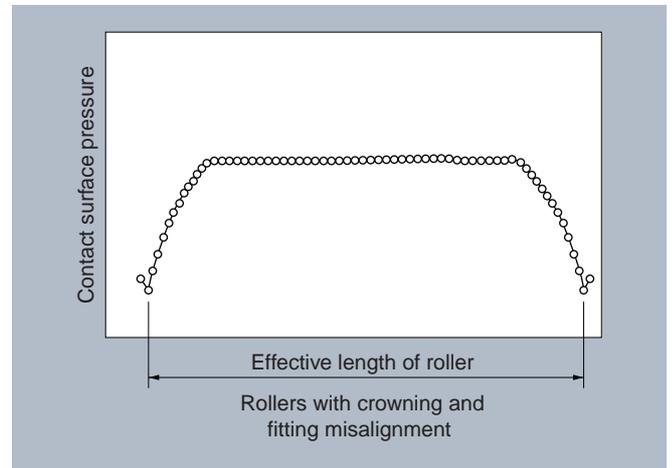

Fig. 2.7

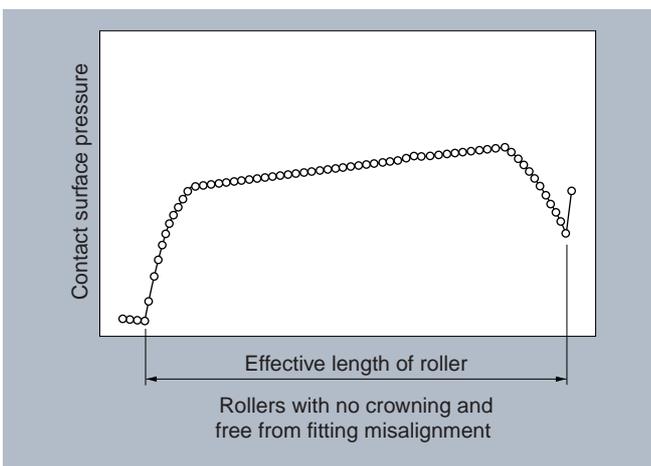

Fig. 2.6

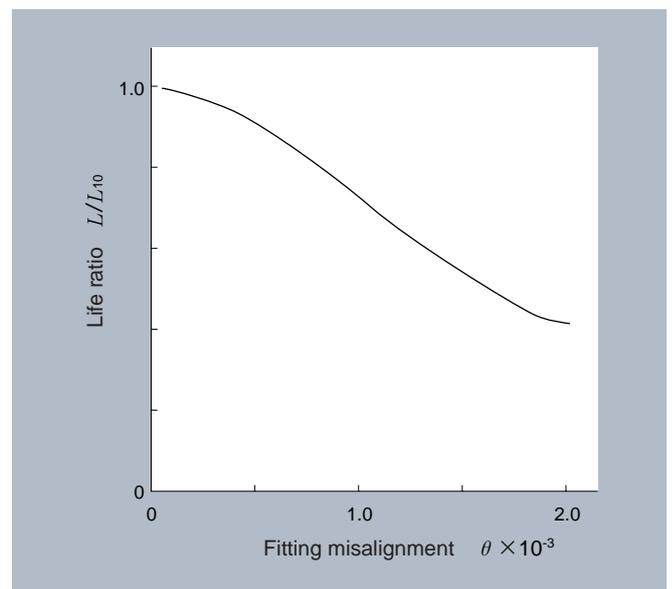

Fig. 2.8 Relationship of fitting misalignment to bearing lifetime

### 2.10 Radial internal clearance, surface roughness and surface hardness, and bearing life

The relationship of radial internal clearance to bearing life is as shown in Fig. 2.9 and the relationship of surface roughness to bearing life as shown in Fig.2.10.

It is possible to see from these Figures how the bearing life is influenced by each factor.

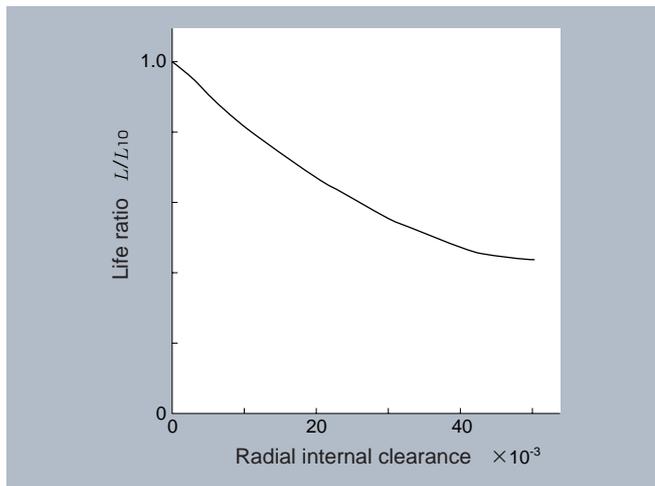

Fig. 2.9 Relationship of radial internal clearance to bearing life

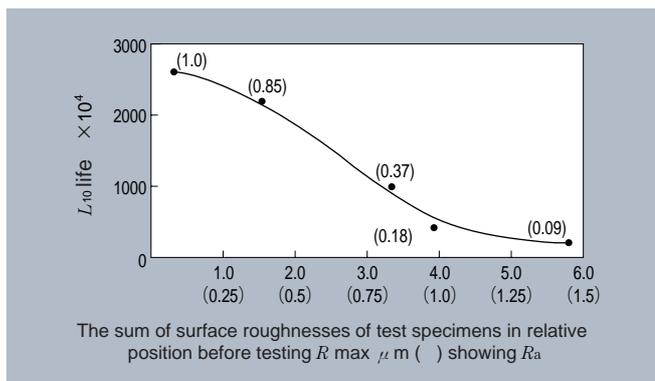

Fig. 2.10 Relationship of surface roughness to bearing life

### 2.11 Basic static load rating

Load acting on a bearing, when acted, results in locally permanent deformation of the contract surface of rolling elements to bearing ring. And this deformation value increases inevitably with the increasing load and smooth rotation of the bearing is interfered with by the deformation when it exceeded a certain limit value.

It is known experimentally that the total permanent deformation value 0.0001 times as large as the rolling element diameter at the contact center of rolling elements to raceway both of which are subjected to maximum stress is an allowable deformation limit which does not interfere with smooth rotation of bearing.

"Basic static load rating" is defined as such a constant static load that results in permanent deformation of the said limit value, which is then expressed in net radial load for radial bearings and in net axial load for thrust bearings.

Regarding this load value, each table of bearing dimensions describes it in the C<sub>or</sub>, field for radial bearings and in C<sub>oa</sub> field for thrust bearings respectively.

When the load defined above acts on a bearing, contact stress at the contact center of rolling element to raceway, which are subjected to maximum load, reaches the following value.

- For roller bearing .....4000MPa (408kgf/mm<sup>2</sup>)
- For ball bearing .....4200MPa (428kgf/mm<sup>2</sup>)

### 2.12 Allowable static bearing load

The basic static load rating prescribed in Subsection 2.11 is generally deemed as an allowable static bearing limit load, but in some cases this allowable limit load is set up larger than the basic static load rating and in some other cases it is set up smaller, according to the requirements for revolving smoothness and friction.

Generally this allowable limit load is decided considering the safety factor S<sub>o</sub> in the following formula (2.14) and Table 2.5.

$$S_o = C_o / P_o \dots\dots\dots(2.14)$$

where,

S<sub>o</sub> : Safety factor

C<sub>o</sub> : Basic static rated load, N (kgf)

(For radial bearings: C<sub>or</sub>,

For thrust bearings: C<sub>oa</sub>)

P<sub>o max</sub> : Maximum static bearing load, N (kgf)

(For radial bearings: P<sub>or max</sub>,

For thrust bearings: C<sub>oa max</sub>)

Table 2.5 Lower limit value of safety factor S<sub>o</sub>

Operating conditions	Roller bearings	Ball bearings
Requirement for high revolving accuracy	3	2
Requirement for ordinal revolving accuracy (ordinary-purposed)	1.5	1
Where minor deterioration of revolving accuracy is allowed (Ex. Low speed revolution, duty load application, etc.)	1	0.5

- Remarks: 1. For the drawn-cup needle roller bearings, 3 shall be adopted as S<sub>o</sub> lower limit value.
- 2. Where vibration and shock load act on bearing, P<sub>o max</sub> shall be determined considering the shock load factor.

### 3. Calculation of Bearing Loads

#### 3.1 Load acting on shafts

The loads acting on the shaft to be supported with the bearing must be determined for calculation of bearing loads. These loads include the self-weight of rotor assy, loads inevitably resulting from a machine in running, loads arising from power transmission, etc. These loads are mostly difficult to calculate though some of them can be calculated numerically and theoretically.

The following paragraphs describe how to calculate the loads acting on a power transmission shaft as one of the main bearing applications.

##### 3.1.1 Load acting on gears

The loads acting on gears can be divided into tangential load ( $K_t$ ), radial load ( $K_s$ ) and axial load ( $K_a$ ). The magnitude and acting direction of each load differ depending on the types of gear. This paragraph describes how to calculate the loads acting on parallel shaft gears and cross shaft gears for general use. For calculation of the loads acting on other gears, feel free to contact NTN for inquiry.

##### (1) Load acting on parallel shaft gear

**Figs. 3.1 to 3.3** illustrate the loads acting on spur gear and helical gear which are used with a parallel shaft. The magnitude of each load can be determined using the **formulas (3.1) to (3.4)**.

$$K_t = \frac{19.1 \times 10^6 \cdot HP}{D_p \cdot n} \left( \frac{1.95 \times 10^6 \cdot HP}{D_p \cdot n} \right) \dots\dots\dots (3.1)$$

$$K_s = K_t \cdot \tan \alpha \text{ (Spur gear)} \dots\dots\dots (3.2a)$$

$$= K_t \cdot \frac{\tan \alpha}{\cos \beta} \text{ (for helical gear)} \dots\dots\dots (3.2b)$$

$$K_r = \sqrt{K_t^2 + K_s^2} \dots\dots\dots (3.3a)$$

$$K_a = K_t \cdot \tan \beta \text{ (for helical gear)} \dots\dots\dots (3.4)$$

where,

- $K_t$  : Tangential load acting on gear  
(Tangential force) N (kgf)
- $K_s$  : Radial load acting on gear  
(separating force) N (kgf)
- $K_r$  : Load acting perpendicularly on gear shaft  
(composite force of tangential force and separating force) N (kgf)
- $K_a$  : Parallel load acting on gear shaft N (kgf)
- HP : Transmission power kw
- $n$  : Rotational speed r/min
- $D_p$  : Pitch circle diameter of gear mm
- $\alpha$  : Gear pressure angle
- $\beta$  : Gear helix angle

Actual gear load is determined by multiplying the theoretical load by the gear factor described in **Table 3.1**, because vibration and shock are added to each theoretical load determined by the above formulas.

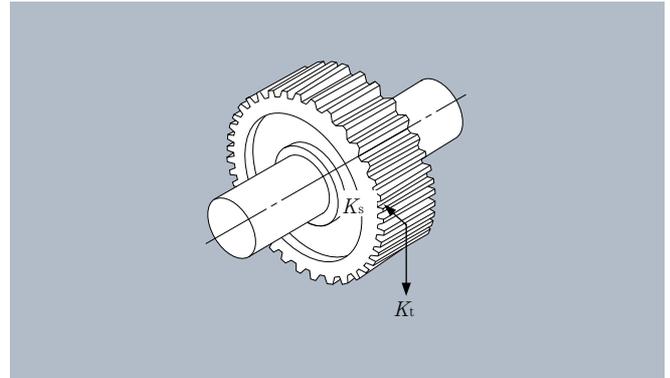

Fig. 3.1 Load acting on spur gear

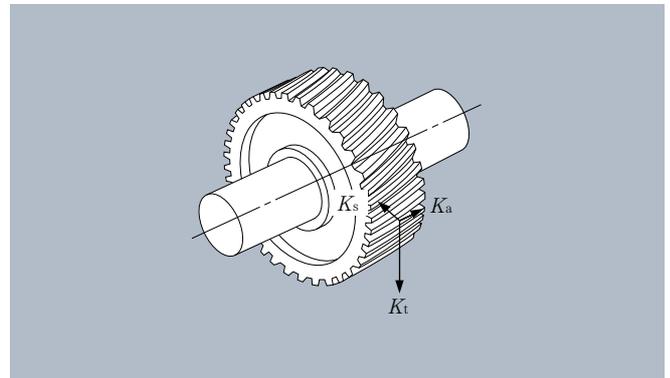

Fig. 3.2 Load acting on helical gear

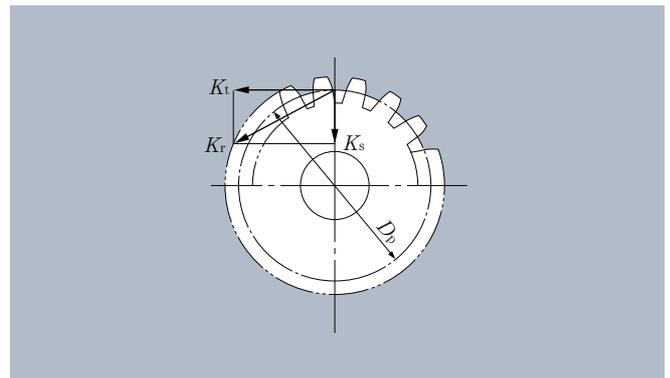

Fig. 3.3 Composite radial force acting on gear

Table 3.1 Gear factor  $f_z$

Types of gear	$f_z$
Precision ground gears (Pitch and profile errors of less than 0.02mm)	1.05~1.1
Ordinary machined gears (Pitch and profile errors of less than 0.1mm)	1.1~1.3

## (2) Loads acting on cross shaft gears

**Figs. 3.4** and **3.5** illustrate the loads acting on straight-tooth bevel gears and spiral bevel gears which are used with cross shafts.

**Table 3.2** shows how to calculate these loads.

The load acting on straight-tooth bevel gear can be determined from **Table 3.2**, assuming the helix angle as  $\beta = 0$ .

The symbols and units used in this table are as follows.

- $K_t$  : Tangential load acting on gear (Tangential force) N (kgf)
- $K_s$  : Radial load acting on gear (separating force) N (kgf)
- $K_a$  : Parallel load acting on gear shaft (axial load) N (kgf)
- HP : Transmission power kw
- $n$  : Rotational speed r/min
- $D_{pm}$  : Mean pitch circle diameter mm
- $\alpha$  : Gear pressure angle
- $\beta$  : Gear helix angle
- $\delta$  : Pitch cone angle of gear

In general, the relationship between the loads acting on pinion and pinion gear can be expressed as follows, due to the perpendicular intersection of two shafts.

$$K_{sp} = K_{ag} \dots\dots\dots (3.5)$$

$$K_{ap} = K_{sg} \dots\dots\dots (3.6)$$

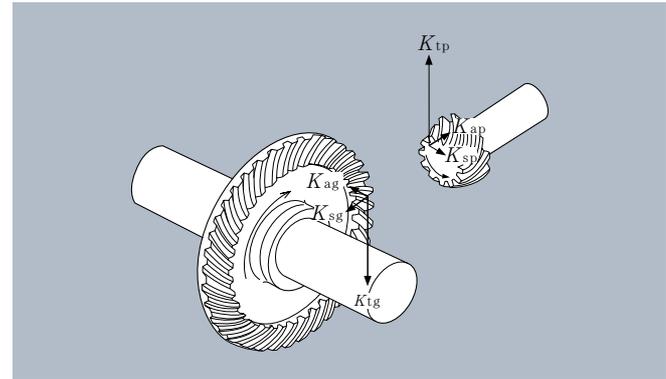

where,

$K_{sp}, K_{sg}$  : Pinion and pinion gear separating force N (kgf)

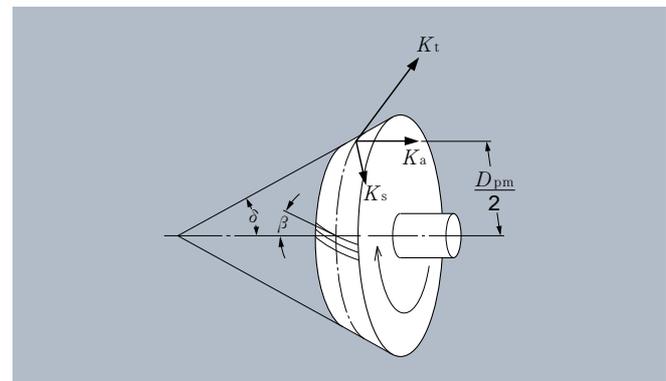

$K_{ap}, K_{ag}$  : Axial load acting on pinion and pinion gear N (kgf)

For spiral bevel gears, the loading direction differs depending on the direction of helix angle, rotational direction and whether the spiral bevel gear is located at the drive side or the driven side.

The separating force ( $K_s$ ) acting direction and axial load ( $K_a$ ) acting direction illustrated in **Fig.3.5** are the positive direction respectively. On the other hand, the rotational direction and helix angle direction are to be defined when viewing from the large end side of the gear. Hence, for the gear illustrated in **Fig. 3.5** these directions are clockwise and to right.

**Fig. 3.4** Load acting on bevel gears

**Fig.3.5** Bevel gear diagram

**Table 3.2** Loads acting on bevel gears

Unit N

Driving gears	Rotational direction	Clockwise	Counter clockwise	Clockwise	Counter clockwise
	Helix angle	To right	To left	To left	To right
Tangential load $K_t$	$K_t = \frac{19.1 \times 10^6 \cdot H}{D_{pm} \cdot n}, \left\{ \frac{1.95 \times 10^6 \cdot H}{D_{pm} \cdot n} \right\}$				
Separating force $K_s$	Drive side	$K_s = K_t \left[ \tan \alpha \frac{\cos \delta}{\cos \beta} + \tan \beta \sin \delta \right]$	$K_s = K_t \left[ \tan \alpha \frac{\cos \delta}{\cos \beta} - \tan \beta \sin \delta \right]$	$K_s = K_t \left[ \tan \alpha \frac{\cos \delta}{\cos \beta} - \tan \beta \sin \delta \right]$	$K_s = K_t \left[ \tan \alpha \frac{\cos \delta}{\cos \beta} + \tan \beta \sin \delta \right]$
	Driven side	$K_s = K_t \left[ \tan \alpha \frac{\cos \delta}{\cos \beta} - \tan \beta \sin \delta \right]$	$K_s = K_t \left[ \tan \alpha \frac{\cos \delta}{\cos \beta} + \tan \beta \sin \delta \right]$	$K_s = K_t \left[ \tan \alpha \frac{\cos \delta}{\cos \beta} + \tan \beta \sin \delta \right]$	$K_s = K_t \left[ \tan \alpha \frac{\cos \delta}{\cos \beta} - \tan \beta \sin \delta \right]$
Axial load $K_a$	Drive side	$K_a = K_t \left[ \tan \alpha \frac{\sin \delta}{\cos \beta} - \tan \beta \cos \delta \right]$	$K_a = K_t \left[ \tan \alpha \frac{\sin \delta}{\cos \beta} + \tan \beta \cos \delta \right]$	$K_a = K_t \left[ \tan \alpha \frac{\sin \delta}{\cos \beta} + \tan \beta \cos \delta \right]$	$K_a = K_t \left[ \tan \alpha \frac{\sin \delta}{\cos \beta} - \tan \beta \cos \delta \right]$
	Driven side	$K_a = K_t \left[ \tan \alpha \frac{\sin \delta}{\cos \beta} + \tan \beta \cos \delta \right]$	$K_a = K_t \left[ \tan \alpha \frac{\sin \delta}{\cos \beta} - \tan \beta \cos \delta \right]$	$K_a = K_t \left[ \tan \alpha \frac{\sin \delta}{\cos \beta} - \tan \beta \cos \delta \right]$	$K_a = K_t \left[ \tan \alpha \frac{\sin \delta}{\cos \beta} + \tan \beta \cos \delta \right]$

### 3.1.2 Loads acting on chain and belt shafts

In the case of power transmission by a chain and a belt, the load acting tangentially on the sprocket or the pulley can be determined by **formula (3.7)**.

$$K_t = \frac{19.1 \times 10^6 \cdot HP}{D_p \cdot n} \left( \frac{1.95 \times 10^6 \cdot HP}{D_p \cdot n} \right) \dots \dots \dots (3.7)$$

where,

- $K_t$  : Tangential load acting on sprocket or pulley N (kgf)
- HP : Transmission power kW
- $D_p$  : Pitch circle diameter of sprocket or pulley mm

In the case of belt driving, initial tension is applied to the belt so the pulley and the belt are both always pressed down with a proper load.

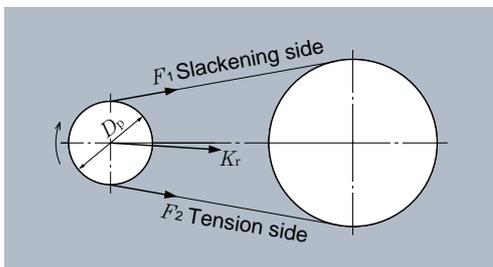

Fig. 3.6 Loads acting on chain/ belt

Considering this initial tension, radial load acting on the pulley is expressed in **formula (3.8)**.

In the case of chain driving, the radial load acting thereon can be expressed using the same formula, if vibration and shock are taken into consideration.

$$K_r = f_b \cdot K_t \dots \dots \dots (3.8)$$

where,

- $K_r$  : Radial load acting on sprocket or pulley N (kgf)
- $f_b$  : Chain/belt factor (Table 3.3)

Table 3.3 Chain/belt factor  $f_b$

Type of chain / belt	$f_b$
Chain (single row type)	1.2~1.5
Vee-belt	1.5~2.0
Timing belt	1.1~1.3
Flat belt (with tension pulley)	2.5~3.0
Flat belt	3.0~4.0

### 3.1.3 Load factor

In an actual machine, the shaft load is mostly greater than the theoretically calculated load due to vibration, shock, etc. The load acting on the shafts of a machine can be determined by **formula (3.9)**.

$$K = f_w \cdot K_C \dots \dots \dots (3.9)$$

where

- $K$  : Actual load acting on shaft N(kgf)
- $K_C$  : Theoretically calculated value N (kgf)
- $f_w$  : Load factor (Table 3.4)

Table 3.4 Load factor  $f_w$

Extent of shock	$f_w$	Application
Nearly no shock	1.0~1.2	Electrical machines, machine tools, measuring instruments
Light shock	1.2~1.5	Railway vehicles, automobiles, rolling mills, metal working machines, paper making machines, rubber mixing machines, printing machines, aircraft, textile machines, electrical units, office equipment
Heavy shock	1.5~3.0	Crushers, agricultural machines, construction machines, cranes

### 3.2 Load distribution to bearings

Any loads acting on shafts are distributed to the bearings considering static tension to be supported with the bearings.

For example, the loads acting on the bearings in the gear shaft illustrated in **Fig. 3.7** can be expressed in **formulas (3.10) and (3.11)**.

$$F_{rA} = K_{rI} \frac{b}{l} - K_{rII} \frac{c}{l} - K_a \frac{D_p}{2l} \dots \dots \dots (3.10)$$

$$F_{rB} = K_{rI} \frac{a}{l} + K_{rII} \frac{a+b+c}{l} + K_a \frac{D_p}{2l} \dots \dots \dots (3.11)$$

where,

- $F_{rA}$  : Radial load acting on bearing-A N (kgf)
- $F_{rB}$  : Radial load acting on bearing-B N (kgf)
- $K_{rI}$  : Radial load acting on gear-I N (kgf)
- $K_a$  : Axial load acting on gear-I N (kgf)
- $K_{rII}$  : Axial load acting on gear-II N (kgf)
- $D_p$  : Pitch circle diameter of gear-I mm
- $l$  : Bearing to bearing distance mm

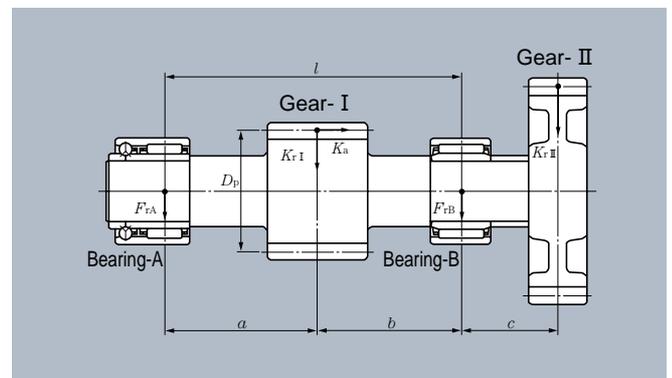

Fig. 3.7 Gear shaft

**3.3 Mean load**

The loads acting on bearings used in ordinary machines fluctuate mostly depending on the predetermined operation cycle or work plan. In such a case, the mean load  $F_m$  converted so the same lifetime is assigned to the bearings is used as the bearing load.

**(1) Stepped fluctuating load**

Where bearing loads  $F_1, F_2, \dots, F_n$  act on and the rotational speed and running time are  $n_1, n_2, \dots, n_n$  and  $t_1, t_2, \dots, t_n$  respectively, the mean load  $F_m$  of these loads can be expressed in **formula (3.12)**.

$$F_m = \left( \frac{\sum (F_i^p n_i t_i)}{\sum (n_i t_i)} \right)^{1/p} \dots \dots \dots (3.12)$$

where:

- $p = 10/3$  for roller bearing
- $p = 3$  for ball bearing

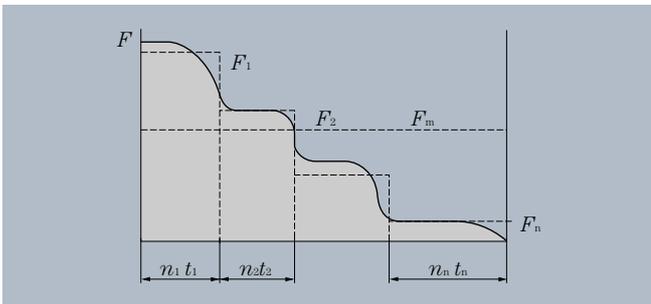

Fig. 3.8 Stepped fluctuating load

**(2) Consecutive series load**

Where load is load cycle " $t_0$ " and it can be expressed in the function  $F(t)$  of time  $t$ , the mean load can be expressed in **formula (3.13)**.

$$F_m = \left( \frac{1}{t_0} \int_0^{t_0} F(t)^p dt \right)^{1/p} \dots \dots \dots (3.13)$$

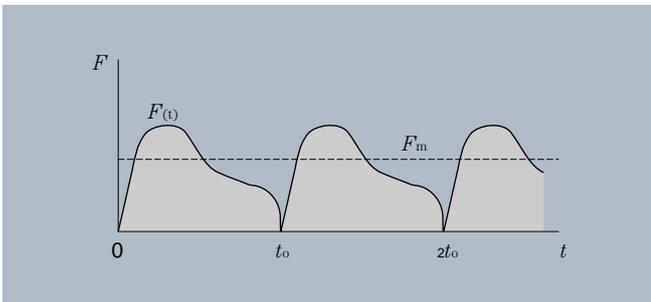

Fig. 3.9 Load fluctuating as a time function

**(3) Load fluctuating in nearly linear form**

The mean load  $F_m$  can be determined approximately by **formula (3.14)**.

$$F_m = \frac{F_{min} + 2F_{max}}{3} \dots \dots \dots (3.14)$$

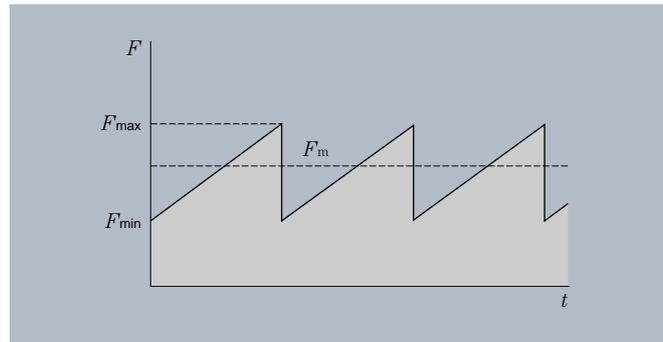

Fig. 3.10 Load fluctuating in linear form

**(4) Sinusoidal fluctuating load**

The mean load  $F_m$  can be determined approximately by **formulas (3.15), (3.16)**.

case of (a)  $F_m = 0.75 F_{max} \dots \dots \dots (3.15)$

case of (b)  $F_m = 0.65 F_{max} \dots \dots \dots (3.16)$

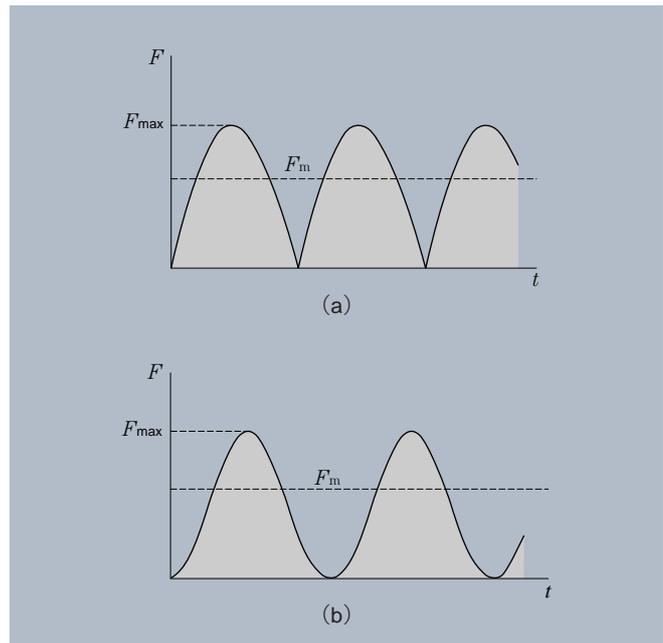

Fig. 3.11 Sinusoidal fluctuating load

## 4. Bearing Accuracy

The dimensional, profile and running accuracies of rolling bearings are specified in ISO Standard as applicable and JIS B 1514 (Accuracy of Rolling Bearings).

"Dimensional accuracy" and "Profile accuracy" are the items indispensable in installing the rolling bearings on a shaft and in a bearing housing, and allowable bearing run-out in running is specified as the running accuracy.

### Dimensional accuracy:

Dimensional accuracy means the respective allowable values for bore diameter, outer diameter, width or height (limited to thrust bearing) and chamfering dimension.

### Profile accuracy:

This means the allowable value for variation of each of bore diameter, mean bore diameter, outer diameter, mean outer diameter, and width or thickness of bearing ring (limited to thrust bearing).

### Running accuracy:

This means the respective allowable values for radial run-out and axial run-out of both inner ring and outer ring, lateral run-out of inner ring, and outer diameter run-out of outer ring.

Regarding the accuracy class of the machined ring needle roller bearings, class-0 is equivalent to bearings of the normal precision class, and precision becomes progressively higher as the class number becomes smaller; i.e. Class 6 is less precise than Class 5, which is less precise than Class 4, and so on.

Bearings of Class-0 are mostly used for general application, while bearings of Class-5 or Class-4 are used, where the required running accuracies and revolutions are high or less friction and less fluctuation are required for bearings.

Various bearing types are available for NTN needle roller bearings and the representative types and the accuracy classes applicable to them are as shown in **Table 4.1**.

Dimensional item symbols used in the accuracy standard are given in **Table 4.2**, the radial bearing accuracy specified every accuracy class given in **Table 4.3**, the thrust bearing accuracy specified every accuracy class given in **Table 4.4**, and the allowable values for chamfering dimension given in **Table 4.5**.

**Table 4.2 Dimensional item symbols used in applicable standards**

Classification	Symbols	Symbol representation	Symbols under JIS B 0021 (Reference)
Dimensional accuracy	$\Delta d_{mp}$	Dimensional tolerance for in-plane mean bore diameter	————
	$\Delta d_s$	Dimensional tolerance for bore diameter	————
	$\Delta D_{mp}$	Dimensional tolerance for in-plane mean outer diameter	————
	$\Delta D_s$	Dimensional tolerance for outer diameter	————
	$\Delta B_s$	Dimensional tolerance for inner ring width	————
	$\Delta C_s$	Dimensional tolerance for outer ring width	————
Profile accuracy	$V_{dp}$	Variation of in-plane bore diameter	Roundness $\bigcirc$ <sup>1)</sup>
	$V_{dmp}$	Variation of in-plane mean bore diameter	Cylindricity $\bigcirc$ <sup>2)</sup>
	$V_{Dp}$	Variation of in-plane outer diameter	Roundness $\bigcirc$ <sup>1)</sup>
	$V_{Dmp}$	Variation of in-plane mean outer diameter	Cylindricity $\bigcirc$ <sup>2)</sup>
	$V_{Bs}$	Variation of inner ring width	Parallelism $//$
	$V_{Cs}$	Variation of outer ring width	Parallelism $//$
Running accuracy	$K_{ia}$	Radial run-out of inner ring	Run-out $\nearrow$
	$K_{ea}$	Radial run-out of outer ring	Run-out $\nearrow$
	$S_{ia}$	Axial run-out of inner ring	————
	$S_{ea}$	Axial run-out of outer ring	————
	$S_d$	Lateral run-out (inner ring)	Run-out $\nearrow$
	$S_D$	Outer diameter run-out (outer ring)	Run-out $\nearrow$

1) The roundness specified in JIS B 0021 is applicable to the tolerance  $V_{dp}$  for variation of radial in-plane bore diameter or nearly half of  $V_{Dp}$ .  
 2) The cylindricity specified in JIS B 0021 is applicable to the tolerance  $V_{dmp}$  for in-uniformity of radial in-plane mean diameter or nearly half of  $V_{Dmp}$ .

## 5. Bearing Internal Clearance

### 5.1 Radial clearance

Radial clearance in bearing (initial radial clearance) means the displacement value of bearing ring when the non-fixed ring was displaced in radial direction with either one of the inner ring and outer ring remained fixed, before the bearing is installed on a shaft or in a housing.

**Machined ring needle roller bearing (with inner ring) ;**

The initial clearance values for this bearing type are as shown in **Table 5.1. Table 5.1 (1)** shows the interchangeable clearances, which are remained unchanged even after inner ring or outer ring was reassembled in. **Table 5.1(2)** shows non-interchangeable clearances, which do not allow reassembly of inner ring or outer ring due to the narrow clearance range. The bearing clearances are represented by the symbols of C2, ordinary, C3 and C4 in the order from the smallest one and the non-interchangeable clearance symbols are followed by "NA" for identification.

**For the radial clearance values for bearing types other than the machined ring needle roller bearings, refer to "Commentary" described in the respective Dimensions Table.**

### 5.2 Running clearance

**5.2.1 Setting up running clearance**

Bearing clearance in running, that is, running clearance gets generally smaller than the initial radial clearance, depending on the fits and temperature difference between the inner ring and the outer ring. This running clearance must be set up optimally because setting up it improperly would lead to shorter life, overheat and vibration or running noise of bearing.

Theoretically the bearing life comes to the maximum when the running clearance of bearing in normal running is slightly negative, but it is difficult to always hold this optimal condition during actual running. If the negative clearance value gets larger due to change of somewhat operating condition, it would cause significant reduction of bearing lifetime and overheat. To avoid such phenomena, generally proper initial radial clearance is selected and set up so the running clearance gets slightly larger than 0 (zero).

In the case of usual operating conditions, in other words, application of the fits based on ordinary load, usual rotational speed and running temperature, etc., an optimal running clearance can be got by selecting an ordinary clearance.

**Table 5.1 Radial clearance in machined ring needle roller bearings**

❷ For bearing with normal clearance, only NA is added to bearing numbers. EX. NA4920NA

## 5.2.2 Calculation of running clearance

The running clearance in bearing can be determined from initial radial clearance, reduced internal clearance incurred by effective interference, and temperature difference between inner ring and outer ring, using **formula (5.1)**.

$$\delta_{eff} = \delta_o - (\delta_f + \delta_t) \quad \text{.....(5.1)}$$

where,

- $\delta_{eff}$  : Running clearance mm
- $\delta_o$  : Initial radial clearance mm
- $\delta_f$  : Reduced internal clearance incurred by effective interference mm
- $\delta_t$  : Reduced internal clearance incurred by temperature difference between inner ring and outer ring mm

### (1) Reduced internal clearance incurred by effective interference

When a bearing is installed on a shaft or in a housing with some effective interference, the inner ring expands and the outer ring shrinks and, as the result, the radial clearance in the bearing reduces correspondingly.

The expansion or shrinkage of inner ring or outer ring is approximately equivalent to 85% of the effective interference though depending on bearing type, shaft or housing profile, dimension and material. For the detail refer to **Table 6.4** on page A-35.

$$\delta_f = 0.85 \cdot \Delta_{deff} \quad \text{.....(5.2)}$$

where,

- $\delta_f$  : Reduced internal clearance incurred by effective interference mm
- $\Delta_{deff}$  : Effective interference mm

### (2) Reduced internal clearance incurred by temperature difference between inner ring and outer ring

When a bearing is in running, the temperature of its outer ring is lower by 5 to 10°C than that of its inner ring or rolling elements. Also, temperature difference between the inner ring and the outer ring gets larger when heat is radiated more from the housing or when the bearing shaft is communicated with a heat source and a heated fluid is flowing through a hollowed shaft. In such a case, the internal clearance reduces corresponding to thermal expansion difference between the inner ring and the outer ring which is incurred by this temperature difference.

$$\delta_t = \alpha \cdot \Delta T \cdot D_o \quad \text{.....(5.3)}$$

where,

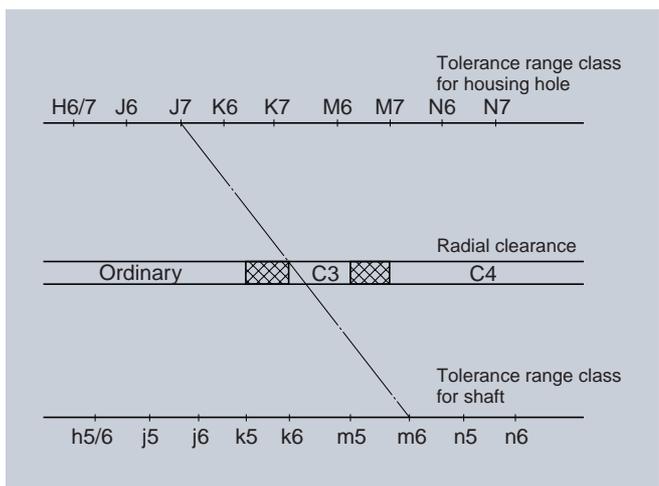

- $\delta_t$  : Reduced clearance value incurred by temperature difference mm
- $\alpha$  : Linear expansion coefficient of bearing steel  $12.5 \times 10^{-6}/^\circ\text{C}$
- $\Delta T$  : Inner ring – outer ring temperature difference  $^\circ\text{C}$
- $D_o$  : Outer ring raceway diameter mm
- $d$  : Bearing bore diameter mm
- $D$  : Bearing outer diameter mm

When a shaft or a housing is used as a direct raceway, temperature difference between the shaft and the housing is applied as temperature difference ( $\Delta T$ ).

## 5.3 Fits and bearing radial clearance

Where the allowable tolerances for the shaft and the housing hole are already decided, the simple nomogram as shown in **Fig. 5.1** is available as a guideline to decision of the initial radial clearance of bearing so as to enable to get an optimal clearance after the bearing was installed on the shaft/in the housing. The nomogram in **Fig. 5.1** is used as the guideline as stated above. For the detail feel free to contact **NTN**.

For example, where the fit condition for needle roller bearing with inner ring is already given as J7m6, **Fig.5.1** shows that clearance C3 must be secured to get the standard running clearance after installation.

**Fig. 5.1 Relationship between bearing fits and radial clearance**

## 7. Bearing Fits

### 6.1 Interference

For rolling bearings, the inner ring and outer ring are fixed on the shaft or in the housing so that relative movement does not occur between the fitted surfaces of the bearing ring and the shaft or housing in radial, axial and rotational directions when a load acts on the bearing. Such a relative movement, if occurred, would result in wear, fretting corrosion, friction crack, etc. on the fitted surfaces, which would then cause damage of the bearing and the shaft or the housing. Furthermore, wear powder invades into the bearing, then causing imperfect rotation, abnormal overheat, vibration, etc.

The most effective way to fix a bearing is to assign an proper interference to the fitted surfaces between the bearing ring and the shaft or the housing and to thereby apply "tight fit" to the bearing. Furthermore, as its advantage this tight fit method supports the thin-walled bearing ring with uniform load throughout its entire circumference without any loss of load carrying capacity.

The needle roller bearing is a bearing type enabling to separate the inner ring and the outer ring from one another and, therefore, it can be installed on a shaft or in a housing with an interference applied to both of its inner ring and outer ring. In the case of "tight fit", the easiness of bearing installation and removal is lost and, therefore, the bearing ring subjected to stationary load can be "loose-fitted".

### 6.2 Necessity of proper fit

Improper fit could lead to damage and shorter life of bearing. Therefore, advance careful analysis is needed for selection of proper fit. Representative examples of bearing defects caused by improper fit are as described below.

- Crack and earlier separation of bearing ring, and displacement of bearing ring
- Wear of bearing ring, shaft and housing caused by creep and fretting corrosion
- Seizure (sticking) caused by less internal clearance
- Insufficient running accuracy and abnormal noise caused by deformed raceway surface

### 6.3 Fit selection

Fit selection is generally done in accordance with the rule specified hereunder.

The loads acting on each bearing ring are divided into running load, stationary load and directionally unstable load according to the direction and characteristic of loads acting on the bearing.

"Tight fit" can be selected for a bearing ring subjected to running load and directionally unstable load and "stationary fit" or "loose fit" be selected for a bearing ring subjected to stationary load. (See **Table 6.1**)

Where load of high magnitude or vibration and shock loads act on a bearing or a light alloy/plastic housing is used, it is necessary to secure a large interference. In that case, **however, the housing rigidity must be considered carefully so as not allow occurrence of split damage, etc.**

For an application subjected to high running accuracy, bearings of high accuracy must be used with a shaft and a housing of higher dimensional accuracy so as not to apply a large interference thereto. Applying a large interference would cause the shaft or housing profile to be transferred to the bearing track, which could then interfere with the bearing running accuracy. The said bearings of high accuracy are used to prevent such possible phenomena.

**Table 6.1 Radial load and bearing fit**

Bearing running conditions	Sketch	Load characteristic	Bearing fit	
			Inner ring	Outer ring
Inner ring : Rotation Outer ring: static Load direction: constant		Rotating inner ring load	Tight fit	Loose fit acceptable, too
Inner ring: static Outer ring: rotation Load direction: rotating with outer ring		Static outer ring load		
Inner ring: static Outer ring: rotation Load direction: constant		Rotating inner ring load	Loose fit acceptable, too	Tight fit
Inner ring: rotation Outer ring: static Load direction : rotating with inner ring		Static outer ring load		
Inner ring: rotation or static Outer ring: rotation or static Load direction: The direction can not be fixed.	Load direction is non-constant due to directional fluctuation, unbalanced load, etc.	Directionally unstable load	Tight fit	Tight fit

6.4 Recommended Fits

The dimensional tolerances for the diameter of a shaft and the hole diameter of a bearing housing, on/in which a bearing is installed, are standardized under the metric system in ISO 286 and JIS B 0401 (Dimensional Tolerances and Bearing Fits). Hence, bearing fits is determined by selection of the dimensional tolerances for shaft diameter and hole diameter as applicable. Fig. 6.1 shows the relationship between shaft diameter and bearing bore diameter and between housing hole

diameter and bearing outer diameter.

Table 6.2 shows the recommended fits for the machined ring needle roller bearings (with inner ring) that are generally selected based on the dimensional and load conditions. Table 6.3 shows the numerical fit values.

For the recommended fits for others than the machined ring needle roller bearings, refer to "Commentary" described in the respective Dimension Tables.

**6.5 Interference Calculation**

**(1) Load and required interference**

When radial load acts on a bearing, the interference required to prevent a clearance between its inner ring and a steel solid shaft can be expressed in **formulas (6.1)** and **(6.2)**.

For  $F_r \leq 0.3 C_{or}$ ,

$$\Delta d_F = 0.08 \sqrt{\frac{d \cdot F_r}{B}} \left( 0.25 \sqrt{\frac{d \cdot F_r}{B}} \right) \dots\dots\dots(6.1)$$

For  $F_r > 0.3 C_{or}$ ,

$$\Delta d_F = 0.02 \frac{F_r}{B} \left( 0.2 \frac{F_r}{B} \right) \dots\dots\dots(6.2)$$

Where,

- $\Delta d_F$  : Required effective interference mm
- $d$  : Bearing bore diameter mm
- $B$  : Inner ring width mm
- $F_r$  : Radial load N (kgf)
- $C_{or}$  : Basic static load rating N (kgf)

**(2) Temperature rise and required interference**

When temperature rise of bearing (difference between bearing temperature and ambient temperature) is inevitable incurred by bearing running, the interference required to prevent a clearance between the inner ring and a steel shaft can be expressed in **formula (6.3)**.

$$\Delta d_F = 0.0015 \cdot d \cdot \Delta T \dots\dots\dots(6.3)$$

Where,

- $\Delta d_T$  : Required effective interference for temperature difference  $\mu m$
- $\Delta T$  : Difference between bearing temperature and ambient temperature  $^{\circ}C$
- $d$  : Bearing bore diameter mm

**(3) Fitting surface roughness and required interference**

The fitting surface is smoothed (surface roughness is made less) by bearing fits so that the interference reduces correspondingly. The interference reduced value differs depending on the fitting surface roughness and generally the following reduction values must be prospected.

- For ground shafts : 1.0 to 2.5mm
- For lathe-turned shafts : 5.0 to 7.0 mm

**(4) Maximum interference**

Bearing ring fitted, with interference, on a shaft or in a housing results in tensile stress or compressive stress. Over-interference could cause cracking /splitting of bearing and short fatigue life of bearing. Therefore, in general the maximum interference is secured at 1/1000 and less of shaft diameter or otherwise it is secured so the circumferential maximum stress generating on the fitting surface comes to 130MPa or less. (See **Table 6.4**)

**(5) Stress and deformation caused by interference**

When bearing ring (solid) is fitted with interference, it deforms elastically and this elastic deformation results in stress.(See **Fig.6.2**) The fitting surface pressure of bearing ring, circumferential tensile stress (inner ring), compressive stress (outer ring) and radial expansion of raceway (inner ring), and shrinkage(outer ring) can be calculated from **Table 6.4**.

**Table 6.4 Deformation and stress caused by bearing fit**

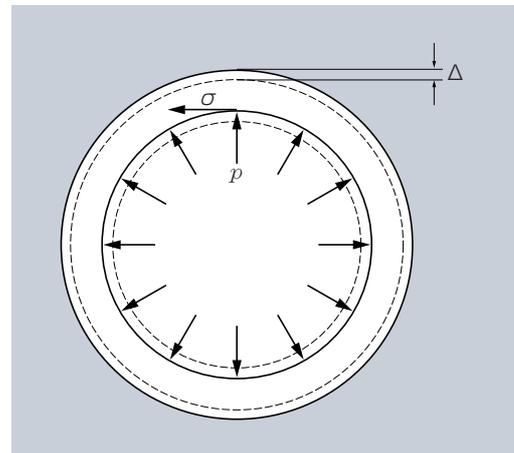

Item	Inner ring	Outer ring
Surface pressure $p$ MPa	$p_i = \frac{E}{2} \frac{\Delta d_{eff}}{d} \frac{(1-k^2)(1-k_o^2)}{1-k^2k_o^2}$	$p_e = \frac{E}{2} \frac{\Delta D_{eff}}{D} \frac{(1-h^2)(1-h_o^2)}{1-h^2h_o^2}$
Circumferential maximum stress $\sigma$ MPa	$\sigma_i = p_i \frac{1+k^2}{1-k^2}$ (Tensile stress)	$\sigma_e = p_e \frac{2}{1-h^2}$ (Compressive stress)
Radial elastic deformation of raceway $\Delta$	$\Delta_i = \Delta d_{eff} \cdot k \frac{1-k_o^2}{1-k^2k_o^2}$ (Expansion)	$\Delta_e = \Delta D_{eff} \cdot h \frac{1-h_o^2}{1-h^2h_o^2}$ (Shrinkage)

Where,

$$k = \frac{d}{d_i}, k_o = \frac{d_o}{d}, h = \frac{D_e}{D}, h_o = \frac{D}{D_o}$$

**Remarks (Symbol representation)**

- $d$  : Inner ring bore diameter (shaft diameter) mm
- $d_o$  : Hollowed shaft bore diameter (For solid shaft,  $d_o=0$ ) mm
- $d_i$  : Inner ring raceway diameter mm
- $\Delta d_{eff}$  : Effective interference for inner ring mm
- $D$  : Outer ring outer diameter (housing hole diameter) mm
- $D_o$  : Housing outer diameter (For sufficient housing size,  $D_o=\infty$ ) mm
- $D_e$  : Outer ring raceway diameter mm
- $\Delta D_{eff}$  : Effective interference for outer ring mm
- $E$  : Modulus of elasticity (Young factor)  $2.07 \times 10^5$  (21200) MPa (kgf/mm<sup>2</sup>)

**Fig.6.2**

## 7. Shaft and Housing Design

Even if the bearing to be used is selected correctly, it can not fulfill its specific function unless the shaft/housing on/in which it is installed is designed correctly. Particularly for needle roller bearings the shaft and the housing must be designed under special consideration because the bearing ring thickness is thinner than that of other rolling bearings.

### 7.1 Design of bearing installing portions

Where a needle roller bearing with cage is used as an individual and is guided in axial direction directly by shaft shoulder (**Fig.7.1**), the shaft shoulder with which the cage side face comes in contact must be finished accurately and also is not allowed to have any raiser thereon. For a needle roller bearing subjected to high speed running, its contact surface is hardened and thereafter fine-finished by grinding.

When a snap ring is used for axial guide of the cage (**Fig.7.1**), a thrust ring is inserted between the cage and the snap ring to prevent the cut section of the snap ring from contacting directly the cage. NTN shaft snap ring WR type specially designed for NTN needle roller bearings is available as the snap ring intended for axial guide of bearing cage. (Refer to Dimensions Table on page B-227.)

On other hand, radial needle roller bearing can move freely in axial direction so that a ball bearing or a thrust bearing is used at single side for axial positioning of the shaft. Where axial load is less and, in addition, rotational speed is not so high (Ex. idle gear in a gear box), a thrust ring is fitted on the shaft, as illustrated in **Fig. 7.2** and a sliding bearing is formed between the thrust ring and the outer ring or the housing end face for the purpose of axial positioning. In such a design, good care must be exercised so the guide surface is fully lubricated. **Fig.7.3** illustrates an example of the above thrust ring with oil groove on its guide surface. The boundary between this oil groove and the plane area must be chamfered for deburring.

In general, for proper installation of needle roller bearing the inner ring and outer ring are both positioned in axial direction so that the bearing displaces in axial direction while running.

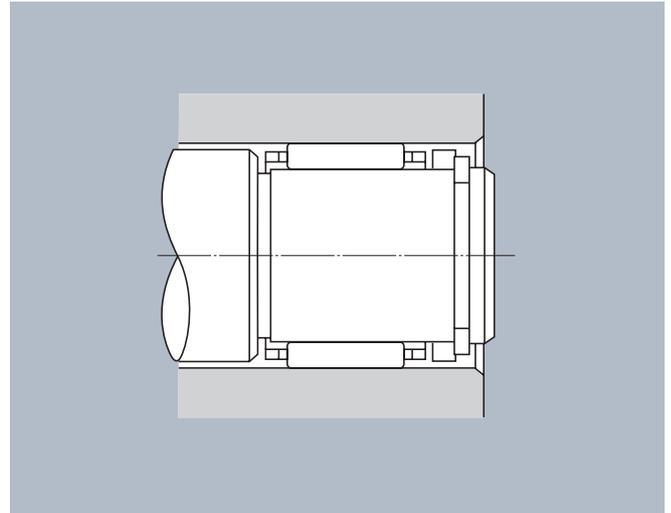

Fig. 7.1 Bearing fixing by thrust ring

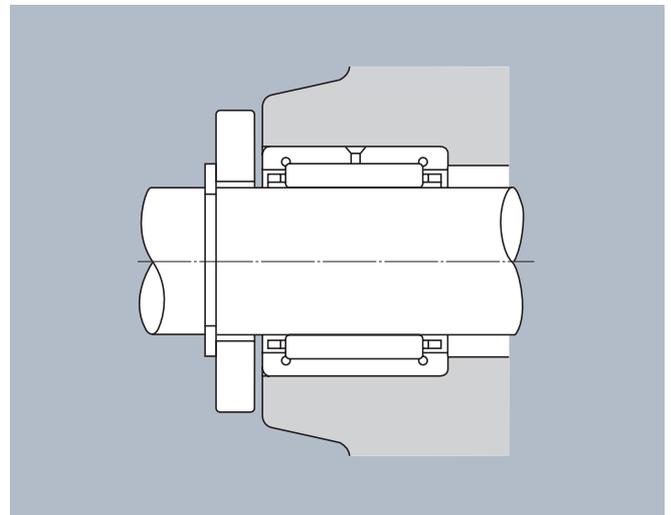

Fig. 7.2 Bearing fixing in axial direction

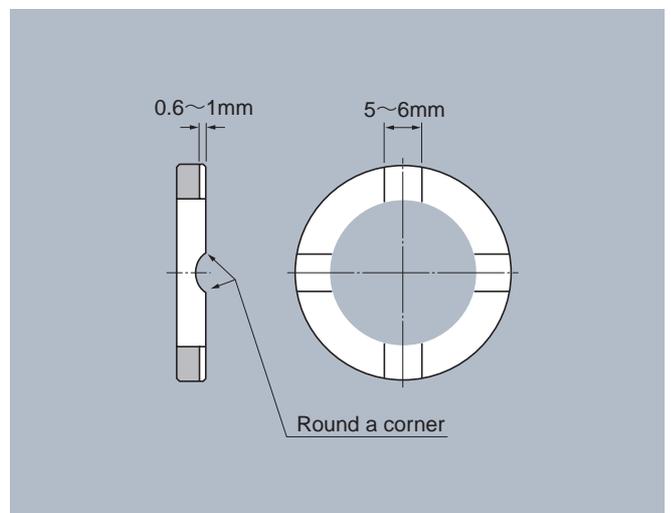

Fig. 7.3 Design of thrust ring guide surface

## (1) Inner ring

For fixing inner ring correctly on a shaft, the shaft shoulder face is finished at the right angle against the shaft axial center and, in addition, the shaft corner is rounded smaller than the inner ring chamfer dimension.

Where the corner roundness  $r_a \text{ max}$  must be made larger for specific shaft strength (**Fig.7.4a**) or the shaft shoulder is low (**Fig. 7.4b**), a spacer must be inserted between the shaft shoulder and the inner ring to hold a full contact surface with the inner ring. Furthermore, for facilitating inner ring pull-out work the shaft shoulder is provided with a notched groove, as illustrated in **Fig. 7.5**, to accept an inner ring pull-out jig (puller).

NTN snap ring WR type for shaft use (Refer to Dimensions Table on page B-227) can be used for simply fixing inner ring in axial direction. (**Fig. 7.6**) Moreover, inner ring can be fixed in axial direction using an end plate or a side ring as illustrated in **Figs. 7.7** and **7.8**.

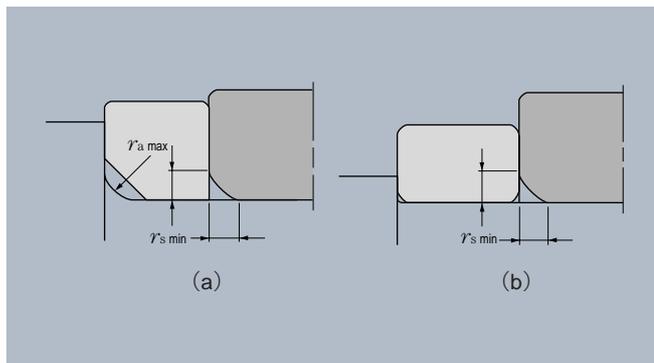

Fig. 7.4 Inner ring fixing by use of spacer

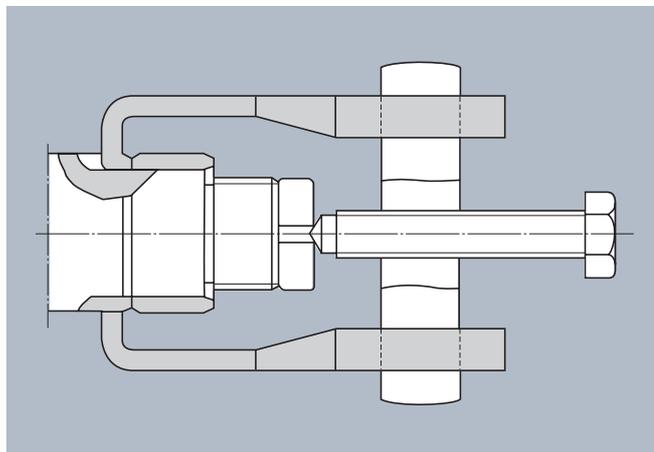

Fig. 7.5 Inner ring pull-out jig (puller)

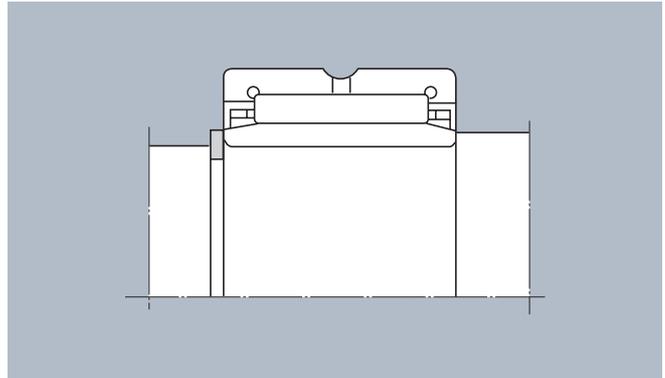

Fig. 7.6 Inner ring fixing by snap ring

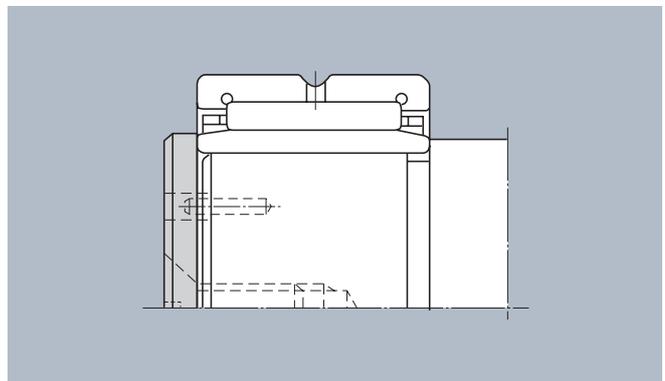

Fig. 7.7 Inner ring fixing by end plate

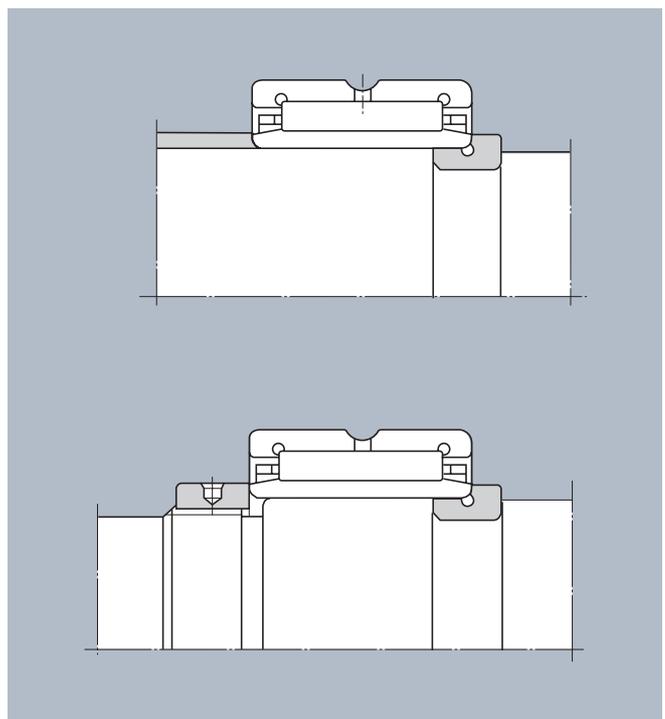

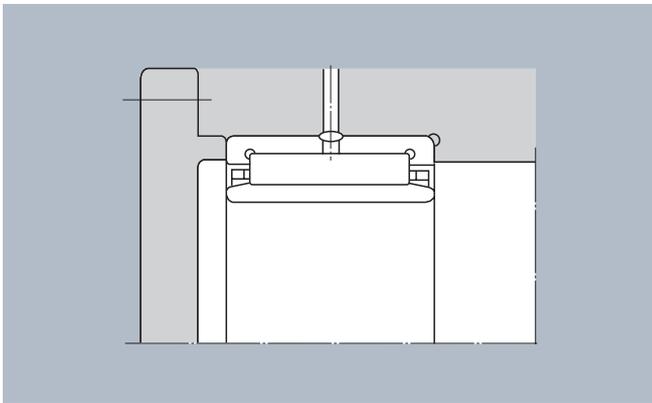

Fig.7.8 Inner ring fixing by side ring

**(2) Outer ring**

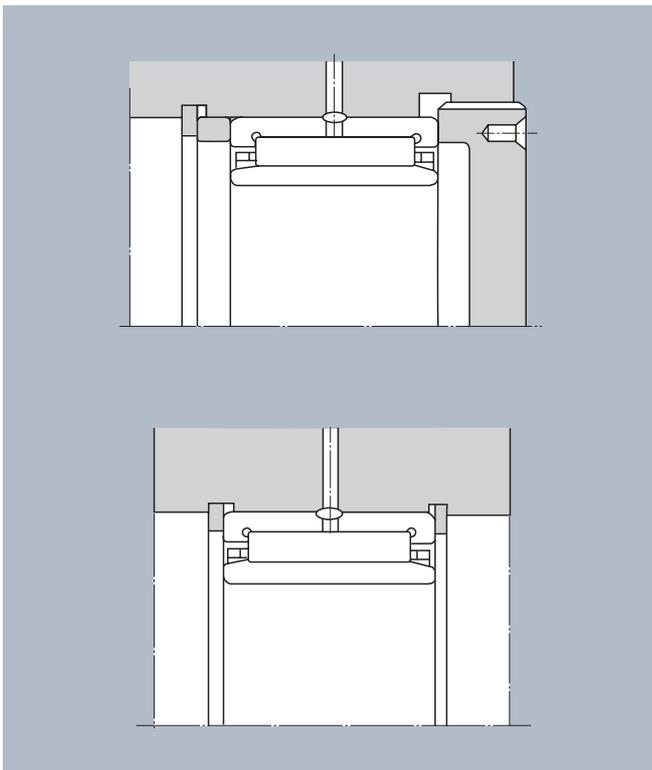

Similarly to Para. 7.1(1) "Inner Ring", good care exercised of the shoulder profile of bearing housing for fixing outer ring in axial direction.

**Figs. 7.9 and 7.10** illustrate the methods of fixing outer ring in axial direction.

NTN housing snap ring BR type (Refer to Dimensions Table on page B-229) can be used for fixing outer ring in axial direction. NTN BR type snap rings are designed to the dimensions adaptable to the needle roller bearings with low section height. However, commercially available snap rings conforming to JIS standard as applicable can also be used for the same bearings with adequately high section height.

**Fig. 7.9** Outer ring fixing by lid

**Fig. 7.10** Outer ring fixing by snap ring

**7.2 Bearing fitting dimensions**

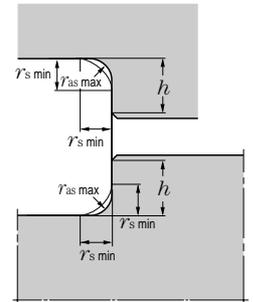

The respective shoulder heights " $h$ " of shaft and housing are designed larger than the maximum chamfer dimension  $r_{s \text{ max}}$  for bearing so the bearing end face comes in contact with the flat zone. And the corner roundness " $r_{as}$ " is designed smaller than the minimum chamfer dimension " $r_s$ " of bearing so as not to interfere with the bearing. Generally the radius of shaft and housing corner roundness shown in **Table 7.1** is used as the shoulder heights of shaft and housing.

The dimensions of the shafts and housings related to bearing installation are as described in the dimensions table for each bearing type. The shoulder diameter shown in this table means the effective shoulder diameter which comes in contact with the side face of bearing excluding the chamfered portion of shoulder.

When the fitting surface of shaft or housing is finished by grinding, the shoulder corner must be provided with a relief. This relief dimension is as shown in **Table 7.2**.

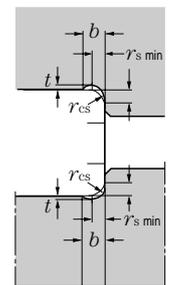

**Table 7.1** Radius of shaft /housing corner roundness and shoulder height

Unit mm		
$r_s \text{ min}$	$r_{as \text{ max}}$	$h \text{ (min)}$
0.15	0.15	0.6
0.2	0.2	0.8
0.3	0.3	1
0.6	0.6	2
1	1	2.5
1.1	1	3.25
1.5	1.5	4
2	2	4.5
2.1	2	5.5
2.5	2	6
3	2.5	6.5
4	3	8

**Table 7.2** Relief grinding dimension for shaft and housing corners

Unit mm			
$r_s \text{ min}$	$b$	$t$	$r_{cs}$
1	2	0.2	1.3
1.1	2.4	0.3	1.5
1.5	3.2	0.4	2
2	4	0.5	2.5
2.1	4	0.5	2.5
3	3.7	0.5	3
4	5.9	0.5	4

### 7.3 Shaft and housing accuracy

Because of its thin wall, the raceway surface accuracy of needle roller bearing ring is influenced by the respective fitting surface accuracy of a shaft /a housing on/in which the needle roller bearing is installed. In the case of general operating conditions, the fitting surfaces of shaft and housing may be finished by lathe-turning, but those must be finished by grinding where the acting load is great and, in addition, the requirements for accuracy and sound are strict.

**Table 7.3** shows the fitting surface accuracy, profile accuracy, surface roughness, and shoulder perpendicularity to fitting surface of each of shaft and housing under ordinary operating conditions.

**Table 7.3 Shaft and housing accuracy**

Characteristic item	Shaft	Housing
Dimensional accuracy	IT6 (IT5)	IT7 (IT6)
Roundness cylindricality (max)	IT3 (IT2)	IT4 (IT3)
Shoulder perpendicularity (max)	IT5 (IT4)	IT5 (IT4)
Fitting surface roughness	0.8a	1.6a

Remarks: The parenthesized values are applied to the bearings of accuracy class 5 and higher.

Where a two-split housing is used, deformation of outer ring by housing clamping can be minimized by providing a relief on the mating surface at bore side.

### 7.4 Raceway surface accuracy

For needle roller bearings, shaft and housing are used as the raceway surface on application. The raceway dimensional accuracy, profile accuracy and surface roughness of shaft/housing must be equivalent to the raceway accuracy of bearing itself. **Table 7.4** shows the specified surface accuracy and surface roughness of shaft/housing raceway.

**Table 7.4 Raceway surface accuracy (recommendation)**

Characteristic item	Shaft	Housing
Dimensional accuracy	IT5 (IT4)	IT6 (IT5)
Roundness cylindricality (max)	IT3 (IT2)	IT4 (IT3)
Shoulder perpendicularity (max)	IT3 (IT2)	IT3 (IT2)
Axial run-out Thrust bearing (max)	IT5 (IT4)	
Surface roughness	For shaft diameter of $\phi$ 80 and less :0.2a For shaft diameter of over $\phi$ 80 to 120 :0.3a For shaft diameter of over $\phi$ 120 :0.4a	

Note) The parenthesized values are applied where high rotational accuracy is required.

### 7.5 Material and hardness of raceway surface

When the outer surface or bore surface of shaft(hollowed) or housing is used as raceway, it must be hardened to HRC58 to 64 for getting sufficient load capacity. For that, the materials shown in **Table 7.5** are used after heat-treated properly.

**Table 7.5 Materials used for raceway**

Kinds of steel	Representative example	Related standards
High carbon chrome bearing steel	SUJ2	JIS G 4805
Carbon tool steel	SK3	JIS G 4401
Nickel chrome molybdenum steel	SNCM420	JIS G 4103
Chrome steel	SCr420	JIS G 4104
Chrome molybdenum steel	SCM420	JIS G 4105
Nickel chrome steel	SNC420	JIS G 4102

When steel is surface-hardened by carburizing or carbonitriding, JIS Standard as applicable defines the depth from surface up to HV550 as an effective hardened layer. The minimum value of effective hardened layer depth is approximately expressed in **formula (7.1)**.

$$E_{ht \min} \geq 0.8D_w (0.1+0.002D_w) \dots\dots\dots(7.1)$$

Where,

$E_{ht \min}$  : Minimum effective hardened layer depth mm

$D_w$  : Roller diameter mm

### 7.6 Allowable bearing inclination

The inner ring and outer ring of bearing incline a little eventually against one another depending on shaft deflection, shaft /housing machining accuracy, fitting deviation, etc. Although this allowable inclination differs depending on bearing type, bearing load, internal clearance, etc., the inclination degree shown in **Table 7.6** must be used as a guideline in the case of general applications because even minor inclination of inner ring and outer ring could cause reduction of bearing life and damage of cage.

**Table 7.6**

Bearing type	Allowable inclination
Radial needle roller bearing	1/2 000
Thrust bearing	1/10 000

## 8. Lubrication

The purpose of lubricating bearings is to form a thin oil film on the rolling and sliding surfaces and to thereby prevent metal to metal direct contact. Furthermore, lubricating rolling bearings has the following effects.

- (1) Reduction of friction and wear
- (2) Discharge of friction heat
- (3) Further extension of bearing life
- (4) Rusting prevention
- (5) Prevention of foreign matter invasion

For achieving these lubrication effects it is necessary to select a good quality lubricant, to remove dust from the lubricant, and to design a proper seal structure for prevention of lubricant leak as well as to adopt the lubrication method suitable to the respective actual operating conditions.

Rolling bearings are mostly lubricated with grease or oil, but solid lubricants such as molybdenum disulfide, graphite, etc. are used for special application.

Further, the comparative data of grease lubrication and oil lubrication given in **Table 8.1** can be utilized as the selection guide.

**Table 8.1** Characteristic comparison of grease lubrication with oil lubrication

Lubrication method Comparative items	Grease lubrication	Oil lubrication
Handling	◎	△
Reliability	○	◎
Cooling effect	×	○ (Recirculation needed)
Seal structure	○	△
Power loss	○	○
Environmental pollution	○	△
High speed running of bearing	×	○

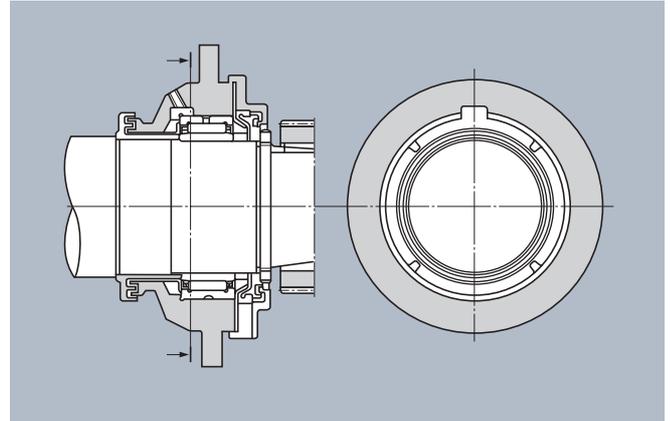

◎ : Extraordinarily advantageous    ○ : Advantageous  
 △ : Fairly advantageous                × : Disadvantageous

### 8.1 Grease lubrication

Grease lubrication is the simplest lubrication method. This method enabling to simplify design of the seal structure is broadly used.

Important points in this lubrication method are to select an optimum grease and to fill it securely in a bearing. Particularly where the cage is guided by the inner ring or outer ring of bearing, good care must be exercised so the guide surface is fully greased throughout its entire area.

Furthermore, for grease replenishment it is desirable to provide a grease sector and a grease valve, etc. as a grease replenisher. **Fig. 8.1** illustrates an example of bearing unit with grease sector and grease valve.

**Fig. 8.1** An example of bearing unit with grease sector and grease valve

#### 8.1.1 Types and characteristics of grease

Lubrication oil is composed of a lubrication base oil (ex. mineral oil base or a synthetic oil base) held with a thickener and various additives added thereto. The properties of grease is determined by the kinds and combination of base oil, thickener and additives.

**Table 8.2** shows the general types of grease and their characteristics. Even the grease of same type is significantly different in the performance depending on the grease brand selected. In selecting a grease brand, therefore, it is necessary to verify the property data submitted from the grease manufacturer.

#### 8.1.2 Base oil

Mineral oil or synthetic oils such as diester oil, and synthetic oil such as silicone oil, fluorocarbon oil, etc. are used as the base oil for grease.

The lubrication performance of grease is mainly determined by the lubrication performance of the base oil. In general, a grease composed of low viscosity base oil is excellent in low temperature characteristic and high speed performance and, on the other hand, a grease composed of high viscosity base oil is excellent in high load characteristic.

#### 8.1.3 Thickener

Thickener is blended and diffused in base oil to hold grease in semi-solid form. And various thickeners are available for use as follows; thickener composed of metallic soap such as lithium, sodium or calcium, etc., thickener composed of inorganic material such as silica gel, bentonite, etc., and non-soap base thickener composed of organic material such as polyurea, fluorocarbon, etc.

The grease characteristics such as critical operating temperature, mechanical stability, durability, etc. are mainly determined by the kind of thickener used. In general, the sodium soap base grease is inferior to others in water resistance. Non-metallic soap base thickener composed of bentone, polyurea, etc. is excellent in high temperature characteristic.

Table 8.2 Grease varieties and characteristics

Grease name	Lithium grease			Sodium grease (Fiber grease)	Calcium compound base grease	Aluminum grease	Non-soap grease	
Thickener	Li soap			Na soap	Ca+Na soap Ca+Li soap	Al soap	Bentone, silica gel, urea, carbon black, etc.	
Base oil	Mineral oil	Diester oil	Silicone oil	Mineral oil	Mineral oil	Mineral oil	Mineral oil	Synthetic oil
Dropping point °C	170~190	170~190	200~250	150~180	150~180	70~90	250 or more	250 or more
Operating temperature range °C	-30~+130	-50~+130	-50~+160	-20~+130	-20~+120	-10~+80	-10~+130	-50~+200
Mechanical stability	Excellent	Good	Good	Excellent to good	Excellent to good	Good to poor	Good	Good
Pressure resistance	Good	Good	Poor	Good	Excellent to good	Good	Good	Good
Water resistance	Good	Good	Good	Good to poor	Good to poor	Good	Good	Good
Applications	Broadest application. Grease for universal type rolling bearings.	Excellent in low temperature characteristic and anti-friction characteristic.	suited to high temperature and low temperature. Low oil film strength and unsuitable for high load application.	emulsified by inclusion of water content. Comparatively excellent in high temperature characteristic.	Excellent in water resistance and mechanical stability. Suitable for bearing subjected to shock load.	Excellent in viscosity characteristic. Suitable for bearing subjected to vibration.	Available for use in wide temperature range from low to high temperature. Some of non-soap base greases are excellent in heat resistance, cold resistance, chemical resistance, etc. subject to proper combination of base oil and thickener. Grease for universal type rolling bearings.	

Remarks: The operating temperature range in this table is the general characteristic value, not the guaranteed value.

8.1.4 Additives

Any greases contain various additives to improve the performance, for example, containing oxidation inhibitor, extreme pressure additives (EP additives), rust inhibitor, corrosion inhibitor, etc.

A grease containing extreme pressure additives is used for bearings subjected to high load or shock load. A grease containing oxidation stabilizer is used for bearing applications wherein the operating temperature is comparatively high and no grease is replenished for a long time.

8.1.5 Consistency

"Consistency" is an index showing the hardness or fluidity of grease. The greater numerical value thereof is the softer hardness. This consistency is determined by the amount of thickener and the viscosity of base oil. Usually NLGI consistency codes 1 and 2 or 3 are used for lubrication of bearings.

Table 8.3 shows the general relationship of grease consistency to application.

8.1.6 Grease mixing

When different greases are mixed together, the consistency of the mixed grease varies (generally softens) so that the allowable operating temperature gets lower. To avoid such characteristic variation of grease, it is not allowed to mix different greases, except mixing greases of same brand.

Where mixing of different greases is inevitable, greases composed of thickener of same kind and similar base oil must be selected. Even when greases of same kind are mixed together, thus, the properties of the mixed grease could vary depending on difference in additives, etc. It is therefore necessary to check the property variation in advance.

Table 8.3 Grease consistency

NLGI consistency No.		JIS (ASTM) 60-cycle mixed grease consistency	Application
0	Soft	355~385	For centralized greasing
1	↑ ↓	310~340	For centralized greasing
2		265~295	For general application, for tight-sealed bearing
3		220~250	For general application, for high temperature
4	Hard	175~205	Special application

8.1.7 Grease fill amount

Grease fill amount differs depending on housing design, spacing volume, rotational speed, kind of grease, etc.

Around 50% to 80% of static spacing volume in bearing and housing is deemed as a guideline to the fill amount. In the case of high rotational speed, this fill amount must be set up a little bit less for controlling temperature rise to a low rate. **Too much fill amount of grease would cause the grease temperature to rise higher, which would then lead to reduction of the specific lubrication performance due to leak of the softened grease or quality change such as oxidation, etc.**

Further, for the machined ring needle roller bearing with inner ring the approximate value of spacing volume in the bearing can be determined by formula (8.1).

$$V = 35W \dots\dots\dots(8.1)$$

where,

V : Internal spacing volume (approximate value) cm<sup>3</sup>

W : Bearing weight kg (See Dimensions Table)

**8.1.8 Grease replenishment**

Lubrication grease must be replenished at an proper interval because its lubrication performance deteriorates with elapse of the bearing running time. However, this replenishing interval differs depending on bearing type, dimension, rotational speed, bearing temperature, kind of grease used, etc.

Fig.8.2 gives the replenishing interval chart as a guideline. This chart is subject to use of a grease for ordinary rolling bearings under usual operating conditions.

Needless to say, the grease replenishing interval must be the shorter as the bearing temperature gets higher. As an approximate guideline, when the bearing temperature is 80°C or more, the replenishing interval shall be shortened by 1/1.5 whenever the bearing temperature rises by 10°C.

**[Ex.]** Determine the grease replenishing interval in the case when bearing **NA4910R** is in running under the conditions of radial load  $P_r$  5kN {510kgf} and rotational speed  $n$  1 600r/min.

$d = 50\text{mm}$ ,

$n_o = 4700$  is determined from NA4910R

$C_r = 48\text{kN}$  (4900kgf) and allowable rotational speed = 4,700 r/min in the Dimensions Table.

Accordingly,

$$\frac{n_o}{n} = \frac{4700}{1600} \doteq 2.9$$

Plot a line horizontally from  $d = 50$  point in Fig. 8.2 and

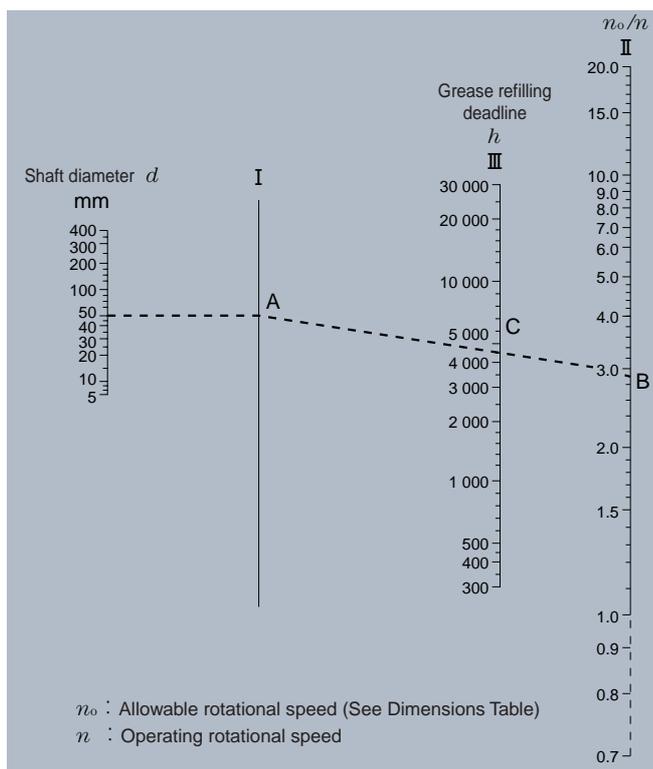

Fig.8.2 Chart for determination of grease replenishing interval

deem the intersection point with the vertical line I as A. Thereafter, connect  $n_o/n=3$  point B on the vertical line II and said A point together, with a straight line, and determine the intersection point C with the vertical line III. And the grease replenishing interval of approximately 4600 hours can be read from the intersection point C.

**8.2 Oil lubrication**

In general, oil lubrication is more suitable for high speed running application or high temperature application than grease lubrication. Oil lubrication is suitable for the case where heat value generating from a bearing or heat value being transferred to a bearing must be discharged outside the bearing.

**8.2.1 Lubrication method**

**(1) Oil bath lubrication**

This oil bath lubrication is the most common of the currently available oil lubrication methods, which is applied to bearings running at low or medium speed. An important point in this method is control of oil level in an oil bath.

For that, when bearings are installed on a horizontal shaft, it is common that a point close to the center of the rolling element in the lowest position should be deemed as the oil level to be secured during shutdown. In this case, the housing must be designed in such a profile as to minimize variation in oil level therein. Furthermore, it is desirable to provide the housing with an oil gauge to facilitate level check during running as well as shutdown.

When bearings are installed on a vertical shaft, it is okay if 50 to 80% of the rolling elements are dipped in an oil bath under low speed running, but in the cases of high speed running and bearings used in multiple rows it is desirable to adopt the drip lubrication and circulating lubrication methods, and others described hereunder.

**(2) Spray lubrication**

This method sprays lubrication oil by an impeller of simple structure, which is mounted on the shaft, without directly dipping a bearing in an oil batch. This can be applied to bearings running at considerably high speed.

**(3) Drip lubrication**

This lubrication method is used where bearing runs at comparatively high speed and medium and less loads act on thereon. In this method, oil drips from an oiler provided on the top of a bearing unit strikes the rolling elements in its housing for atomizing lubrication (Fig. 8.3) or otherwise a small amount of oil passes through the bearing. In many cases bearing is lubricated with several drips per minute though the number of oil drips per specific unit differs depending on bearing type and dimension.

**(4) Circulating lubrication**

This circulating lubrication method is adopted to cool down bearings or to lubricate automatically many lubricating portions by a centralized lubrication system. In more detail, as the features of this method the oil feed line is equipped with a cooler to cool down the lubrication oil and, in addition, provided with an oil filter to purify the lubrication oil.

Under this circulating lubrication system, the lubrication oil must securely be discharged from each bearing after having passed through it. For that, it is important to provide an oil inlet and an oil outlet on each bearing in opposite position and to make the oil discharge port size as large as possible or otherwise to discharge the oil compulsorily. (Fig.8.4)

**(5) Others**

Jet lubrication, oil mist lubrication, air-operated oil lubrication, etc. are available as other lubrication methods.

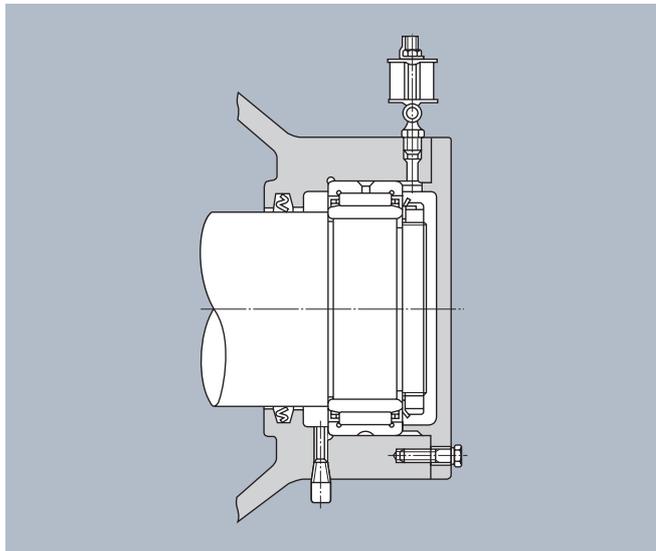

Fig. 8.3 Drip lubrication

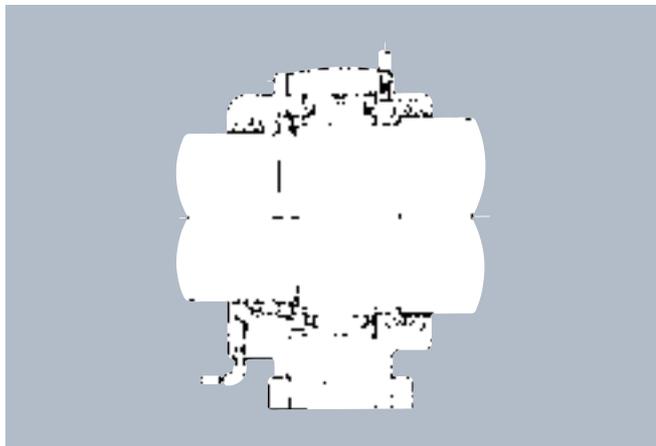

Fig.8.4 Circulating lubrication

**8.2.2 Lubrication oil**

Mineral oils such as spindle oil, machine oil, turbine oil, etc. are mostly used as the lubrication oil for bearings. However, synthetic oils such as diester oil, silicone oil, fluorocarbon oil, etc. are used under the operating conditions wherein bearings are subjected to running at high temperature of 150°C and over or low temperature of -30°C and less.

For lubrication oil, its viscosity is one of the important characteristics that determine the lubrication performance. Too low viscosity of lubrication oil would cause imperfect forming of an oil film and finally cause damage of bearing surface, while too high viscosity of lubrication oil would cause great viscosity resistance, which would then lead to temperature rise and increase of friction loss.

Generally lubrication oil of lower viscosity is used for the faster rotational speed of bearing, while lubrication oil of higher viscosity is used for the heavier bearing load.

Lubrication of bearings needs the oil viscosity every each operating temperature which is specified in Table 8.4. Fig. 8.5 shows the lubrication oil viscosity - temperature characteristic chart, which is referred to in selecting a lubrication oil of optimal viscosity under actual operating temperature.

Furthermore, Table 8.5 shows the criterion for selection of the lubrication oil viscosity according to the actual bearing operating conditions.

Table 8.4 Oil viscosity required for each bearing type

Bearing type	Required viscosity mm <sup>2</sup> /s
Radial needle roller bearing	13
Thrust needle roller bearing	20

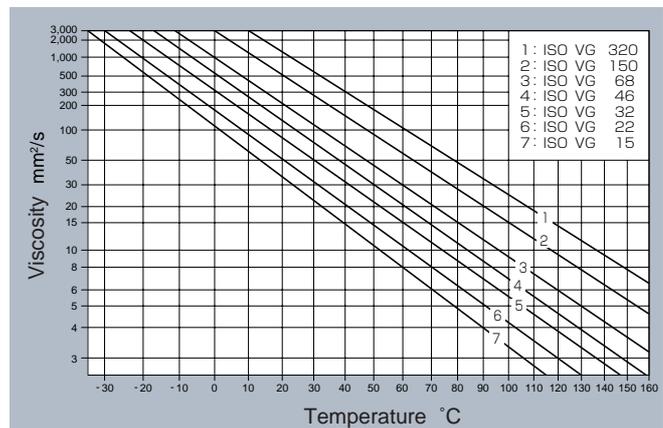

Fig. 8.5 Lubrication oil viscosity - temperature characteristic chart

**Table 8.5 Criteria for selection of lubrication oil (Reference)**

Bearing operating temperature °C	$d_n$ value	ISO viscosity grades for lubrication oil (VG)	
		Ordinary load	Heavy load or shock load
-30~0	up to allowable rotational speed	22 32	46
0~60	up to 15000	46 68	100
	15 000~80 000	32 46	68
	80 000~150 000	22 32	32
60~100	up to 15000	150	220
	15 000~80 000	100	150
	80 000~150 000	68	100 150
100~150	up to allowable rotational speed	320	

Remarks:  
 1. Subject to oil bath lubrication or circulating lubrication.  
 2. Apply to NTN for other operating conditions other than those specified in this Table.

**8.2.3 Oil quantity**

Under an forced oil lubrication system, heat value generating from bearing, etc. is equal to the sum of heat value radiated from housing and heat value carried away by lubrication oil.

Where a standard housing is used, the oil lubrication quantity as a guideline can be determined by **formula (8.2)**. The radiated heat value differs depending on the shape /profile of a housing used. It is therefore desirable to determine the lubrication quantity best-suited to an actual equipment by adjusting it from a value approximately 1.5 to 2 times as much as the lubrication rate determined by formula (8.2). In addition, Where the lubrication quantity is calculated assuming that the generated heat value is all carried away by the oil, with no heat radiation from the housing, the oil quantity  $q$  can be determined, assuming that the shaft diameter on 2nd vertical line from the right side in (Fig. 8.6) Chart for Determination of Oil Quantity  $q$  is  $d=0$ .

$$Q = K \cdot q \dots\dots\dots(8.2)$$

Where,

$Q$ : Oil quantity per bearing  $\text{cm}^3/\text{min}$

$K$ : Coefficient being determined by operating temperature rise of oil (**Table 8.6**)

$q$ : Oil quantity that can be determined from the chart  $\text{cm}^3/\text{min}$  (**Fig.8.6**)

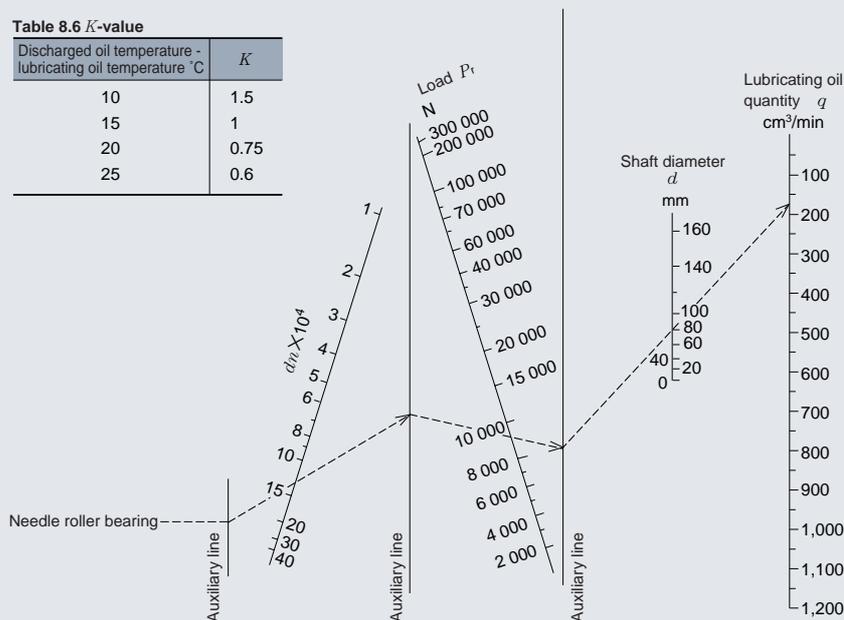

**8.2.4 Fresh oil refilling interval**

**Although it depends on actual operating conditions, oil quantity and the kind of lubrication oil used, the fresh oil refilling interval as a guideline is around one year where bearings are lubricated with oil of 50°C and lower temperature by the oil bath method and is at least 3 months where bearings are lubricated with oil of 80 to 100°C.**

**For an important equipment it is desirable to monitor periodically the lubrication performance, cleanliness deterioration, etc. of the lubrication oil in use and to specify the fresh oil refilling interval under the monitor data.**

**Table 8.6 K-value**

Discharged oil temperature - lubricating oil temperature °C	$K$
10	1.5
15	1
20	0.75
25	0.6

**Fig. 8.6 Chart for determination of lubricating oil quantity**

## 9. Sealing Devices

### 9.1 Non-contact seal and contact seal

The purpose of using a seal is to prevent a lubricant held in a bearing from leaking outside the bearing and to prevent powder, water content, etc. from invading into the bearing from outside.

It is very important to design a sealing device with good care, under full consideration of the operating conditions,

lubricating condition, environmental condition, economical merit, etc., so that bearing running is not inversely affected by the sealing device.

The bearing seals are mainly classified into non-contact seal, contact seal, etc. as shown in **Tables 9.1** and **9.2**, which must then be selected correctly according to each application, under full consideration of the characteristics of each sealing type.

Table 9.1 Seals (Non-contact seals)

		Non-contact seals		
Type		Seal type using a spacing	Seal type using a centrifuge	Seal type using air pressure
Seal name		Oil groove seal Labyrinth seal (axial, radial)	Slinger seal	Air seal
Features		<p><b>&lt;Oil groove seal&gt;</b> This seal is fitted at either one side of a housing or a shaft, or fitted at the both sides for sealing action. In this case, this seal has also an effect in preventing invasion of foreign matter from outside by holding grease in the oil groove.</p> <p><b>&lt; Labyrinth seal &gt;</b> This seal having a high sealing effect due to its multi-stage labyrinths and long passage is mainly used for grease lubrication. Generally it is suited to high speed bearing running, but it has a dust-proofing effect even under low speed running if the seal grooves are filled up with grease. It is convenient if this seal is provided with a grease nipple.</p>	<p>In oil lubrication, this seal has an effect in slinging and returning the oil flown out along its sleeve by a centrifugal force if its sleeve is provided with projections.</p> <p>A seal example illustrated in <b>Fig. 9.6</b> prevents invasion of foreign matter from outside.</p>	
Application examples		 <p>Fig. 9.1 Oil groove seal</p>	 <p>Fig. 9.4 Slinger with projections</p>	
		 <p>Fig. 9.2 Axial labyrinth seal</p>	 <p>Fig. 9.5 Slinger intended for back flow of flown-out oil by centrifuge</p>	
		 <p>Fig. 9.3 Radial labyrinth seal</p>	 <p>Fig. 9.6 Slinger provided at outer side</p>	

Table 9.2 Seals (Contact seals)

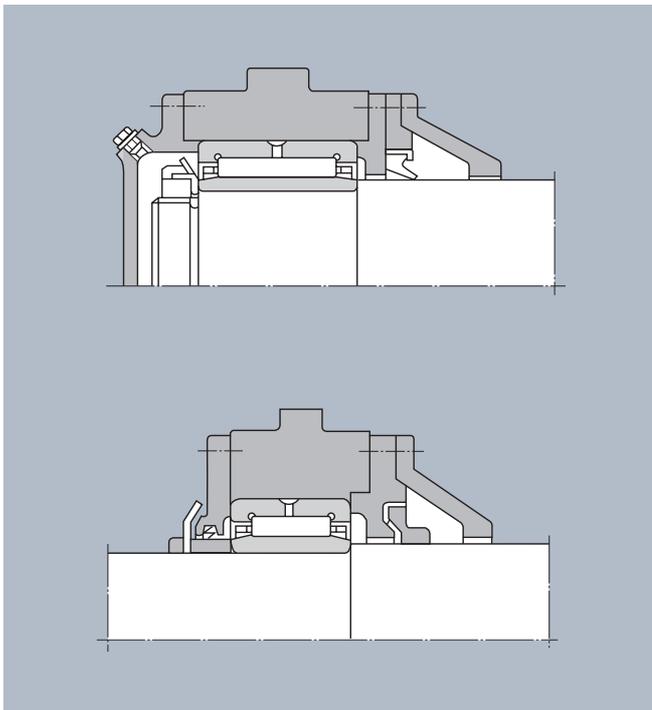

Seal type	Contact seals	
	Seal using mainly direct contact	Seal using mainly fluid lubrication and boundary lubrication
Seal name	Seal ring (felt seal, etc.) O-ring, piston ring	Oil seal, V-shaped ring seal, mechanical seal
Features	<p>This seal type seals a fluid perfectly by pressing its elastic body onto the sliding surface with a constant contact pressure. Generally the contact seals are more excellent in sealing performance than the non-contact seals, but the friction torque and temperature rise thereof are greater than those of the non-contact seals.</p> <p><b>&lt;Felt seal&gt;</b> This is the simplest of the contact seals, which is mainly used for grease lubrication and suited to prevention of fine dust, but oil penetration and outflow are occasionally unavoidable to some extent.</p>	<p><b>&lt; Oil seal &gt;</b> This seal type intended to seal lubricant at the sliding portion between its lip and a shaft has good sealing effect and is an effective seal in the most frequent use. The lip must be oriented outward to prevent invasion of water content and foreign matter from outside and oriented inward to prevent lubricant from leaking out of the housing. Furthermore, another seal type with two or more lips is also available for preventing lubricant leak and dust-proofing individually.</p>
Application examples	 <p>Fig. 9.7 Felt seal</p>	 <p>Fig. 9.10 Oil seal</p>
	 <p>Fig. 9.8 Z type grease seal</p>	
	 <p>Fig. 9.9 GS type grease seal</p>	

## 9.2 Combined seals

Several seal types are used in combination for a seal application under an environment where dust, water content, etc. exist so much or for mechanical portions which are not allowed to be contaminated by lubricant leak.

**Fig. 9.11 Combined non-contact seal**  
Combination of labyrinth seal and oil groove seal

**Fig. 9.12 Combined seal**  
Combination of contact seal and non-contact seal

## 9.3 Clearance setting

Oil groove seal and labyrinth seal have the better sealing effect as the shaft - housing clearance gets the smaller, but the actual clearance is generally selected from the following clearance values, under consideration of machining and assembling conditions, shaft deformation, etc.

**Table 9.3 Clearances**

Seal type	Shaft diameter	Radial clearance	Axial clearance
Oil groove seal	50 and less	0.2~0.4	—
	Over 50 to 200	0.5~1.0	
Labyrinth seal	50 and less	0.2~0.4	1.0~2.0
	Over 50 to 200	0.5~1.0	3.0~5.0

## 9.4 NTN seals

Special-purposed NTN seals are available for the needle roller bearings. (Refer to **Table 9.4** on page A-48.) For the more detailed information refer to "Dimensions Table" on page B-233.

## 9.5 Seal materials and corresponding operating temperature ranges

The oil seal lip is ordinarily made of nitril rubber, but acrylic rubber, silicone rubber and fluoro-rubber are used as the lip material according to atmosphere temperature, an objective to be sealed, etc. **Table 9.5** shows the operating temperature ranges available for the respective materials.

**Table 9.5 Seal materials and corresponding operating temperature ranges (Reference)**

Seal materials	Operating temperature ranges °C
Nitril rubber	-25~+100
Acrylic rubber	-15~+130
Silicone rubber	-70~+150
Fluoro-rubber	-30~+180
Felt	-40~+120

## 9.6 Seal types and allowable speed

The allowable speed for the contact seal type depends on the surface roughness, accuracy and lubrication property of sliding surface, operating temperature, etc. **Table 9.6** shows the allowable speed every each seal type, as a guideline.

**Table 9.6 Seal types and corresponding allowable speed (Reference)**

Seal types	Allowable peripheral speed m/s
Felt seal	4
Grease seal	6
Oil seal (Nitril rubber)	15
Oil seal (Fluoro-rubber)	32
V-ring seal	40

Table 9.4 Seals (NTN contact seals)

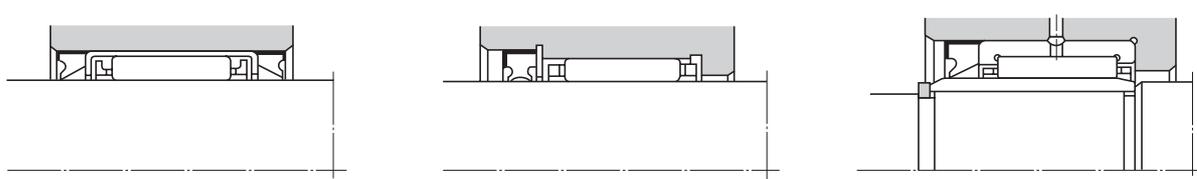

Seal type	Contact seals (G type, GD type)	
	Seal using mainly direct contact	
Features	<p>This seal type is a special-purposed seal for needle roller bearings which was designed for smaller section height so as to correspond flexibly to the said bearings.</p> <p>This is a synthetic rubber contact seal reinforced with steel plate, being then used in the operating temperature range of -25 to +120°C and, under continuous running condition, used at 100°C and less. For application under special operating conditions of over 120°C at operating temperature, etc., feel free to contact NTN for any inquiry.</p>	
Application examples		

Fig. 9.13 Bearing sealing by NTN seals (Example)

### 9.7 Shaft surface roughness

Sealing performance and seal life depend on the surface roughness, accuracy and hardness of shaft sliding surface with which the seal lip comes in contact.

**Table 9.7** shows the surface roughness as a guideline. For improving better the wear resistance of shaft surface it is desirable to secure the shaft surface hardness at least at HRC40 and over (at HRC55 and over if possible) by heat treatment and hard chrome plating.

Table 9.7 Shaft surface hardness (Reference)

Peripheral speed m/s		Surface roughness
over	incl.	Ra
	5	0.8a
5	10	0.4a
10		0.2a

## 10. Bearing Handling

A rolling bearing is a precision part. It must be handled very carefully to keep its preciseness unchanged. Particularly the handling instructions given hereunder must be observed in handling.

### [1] Keeping bearing and other related parts clean

Foreign matters such as mist, dust, etc. would cause harmful affect on bearing running and life. To avoid such harmful effect, bearing and other parts mounted adjacent to the bearing must be kept clean and, in addition, handling tools, lubricant, washing oil, work environment, etc. must always be maintained in clean condition respectively.

### [2] Careful handling

Any shock to a bearing in handling would result in surface flaw and indent of its raceway surface and rolling elements and, in the worst case, result in cracking and chipping. To avoid such defects and trouble, bearings must be handled with good care.

### [3] Use of proper handling tools

It should be avoided to use another inappropriate tool as an alternative of the specific tool in installing and removing.

Specific tools suited to the individual bearing types must be used. The special-purposed handling tools must be used particularly when installing a drawn cup needle roller bearing.

### [4] Protection of bearing from rusting

A rust preventive oil is coated on all of bearings, as a rule. However, direct handling of bearings by the bare hands would cause rusting of the bearings from adhesion of hand sweat thereto. To protect bearings from rusting, a pair of gloves must be put on or otherwise mineral oil be coated on the hands in the case of direct handling by the bare hands.

### 10.1 Bearing storage

Bearings are all shipped after coated with rust inhibitor and packaged. It is desirable to store bearings at room temperature and relative humidity of 60% and less. The storage period of a grease-filled and sealed bearing is limited to the specific lifetime of non-greased bearing.

### 10.2 Installation

Although depending on bearing type and fitting conditions, the bearing installing methods described hereunder are selectively available as the general method. However, refer to Commentary given in the Dimensions Table for installation of the drawn cup needle roller bearings.

#### (1) Preparations prior to installing

For installation of bearings it is desirable to prepare a cleaned and dried work place.

Contaminant, burr, chips, etc. must be removed completely from all the parts related to a shaft and a housing before installing.

Furthermore, the bearing mount must be inspected to verify whether its dimensional accuracy, profile accuracy and surface roughness are within the respective specified tolerance ranges.

Bearings are all unpacked before installing. In the case of using bearings with grease lubrication, generally they may be installed as are without washing off the rust inhibitor coated thereon.

Where a bearing is used with oil lubrication or the lubricating function of a grease-lubricated bearing is impaired by a mixture of grease and rust inhibitor, however, the bearing must be installed after complete removal of the rust inhibitor by clean washing oil.

**It is not allowed to wash shield type and seal type bearings and one-way clutch.**

#### (2) Press-fit by a press machine

In general, the press-fit method using a press machine is widely used for installation of bearings. In detail, the bearing ring (inner ring or outer ring) is press-fitted slowly via a backing strip as illustrated in Fig. 10.1. **It is not allowed to apply the press force to a bearing via its rolling elements like a bad example illustrated in Fig. 10.2 (page A-50).**

Further, a small size bearing with small interference may be installed by hammering the bearing ring with a plastic hammer or the like. **In that case, however, the uniform hammering force must be applied to the bearing side face via the backing strip as illustrated in Fig. 10.1, because direct hammering to the bearing end face or partial hammering by use of a punch could impair the specific bearing performance.**

Fitting the inner ring on a shaft by hammering the outer ring or fitting the inner ring by hammering itself would result in surface flaw and indent of the raceway surface and the rolling elements. Therefore, doing so must be avoided absolutely.

Also, friction of the fitting surface can be reduced by coating high viscosity oil on the surface.

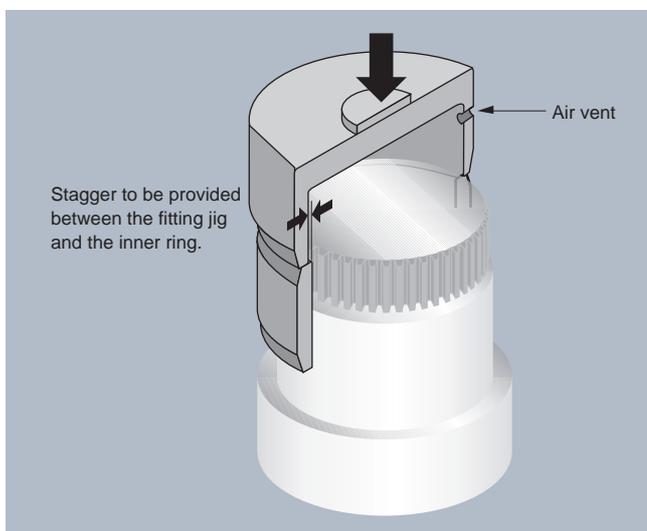

Fig. 10.1 Press-fitting of inner ring

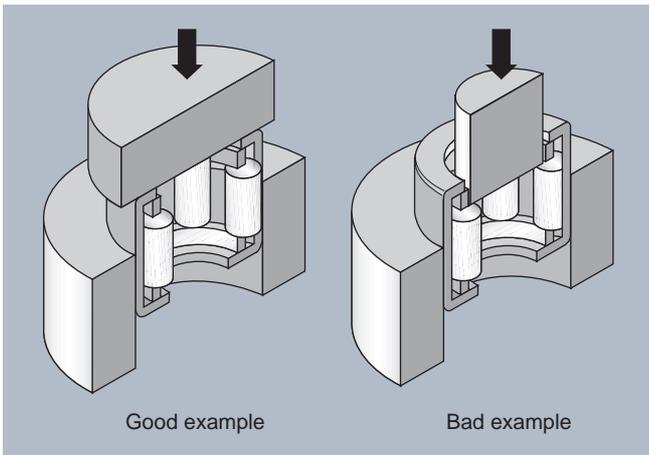

Fig.10.2 Press-fit

**(3) Shrinkage fit**

This shrinkage fit method is to fit the inner ring on a shaft after dipping it in hot oil for thermal expansion of its bore. This method is also widely used for installation of bearings. In heating the inner ring, low-corrosive mineral oil or the like is used. In this case, the heated inner ring is natural-cooled down after shrinkage-fit, but simultaneously it shrinks in axial direction, too. Therefore, the inner ring must be pressed to the shaft shoulder until adequate cool-down, so as not to allow a clearance between the inner ring and the shoulder.

In any case, however, it is not allowed to heat the inner ring up to over 120°C.

Fig. 10.3 shows the relationship of inner ring bore thermal expansion to heating temperature.

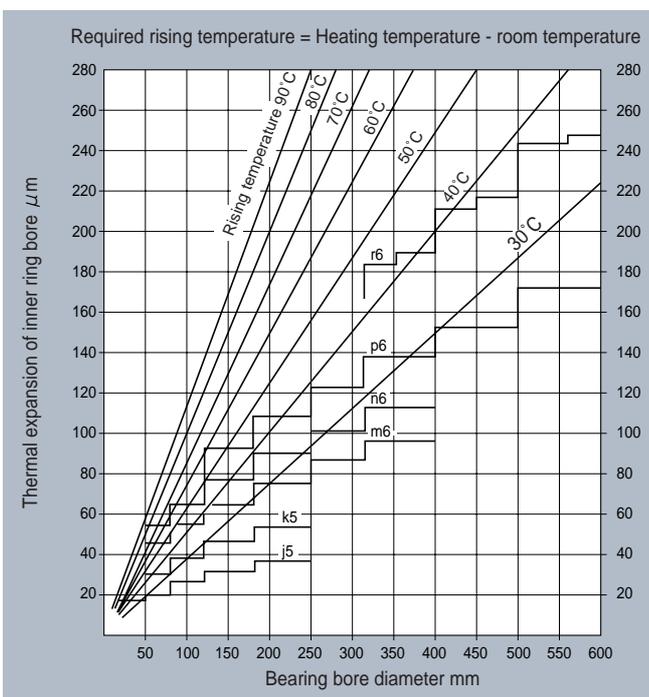

Fig. 10.3 Rising temperature required for shrinkage fit of inner ring

**10.3 Post-installation running test**

Bearing running test must be conducted on an installed bearing to check whether it was installed correctly. In this case, accelerating immediately the running speed up to the rated speed must be avoided absolutely. Doing so could result in damage of the bearing in the case of imperfect installation and seizure of the bearing in the case of inadequate lubrication. In testing, therefore, the shaft or the housing must first be rotated by hand and thereafter the shaft be rotated at low speed under no-load condition by the driving power, unless any failure is detected upon checking. After that, the running speed and load on the bearing must be accelerated and increased gradually while checking the running condition.

Running sound level and tone of a bearing can be checked by a sound scope held in contact with the bearing housing. The sound is normal if it is a pure sound upon checking. In this case, high metallic sound or irregular sound from the bearing, if any, reveals occurrence of somewhat failure. In such a case, possible cause of the failure can be presumed by measuring quantitatively vibration amplitude and frequency using a vibrometer.

Generally bearing temperature is presumed from the circumferential temperature of a housing. However, it can be judged more exactly if possible to measure directly the outer ring temperature by utilizing the oil hole thereof, etc.

Needless to say, bearing temperature rises with elapse of the running time and reaches a constant level after a certain time. Rapid bearing temperature rise or continued temperature rise in excess to the constant level or abnormally high bearing temperature would reveals occurrence of somewhat failure. In such a case, careful check is required.

Table 10.1 shows the required check items.

Table 10.1

Hand operation	Variation in torque Over-torque Chattering Abnormal sound	Imperfect installation Under-clearance, great seal friction, etc. Indent and flaw on raceway surface Inclusion of dust and other foreign matter
Power operation	Abnormal noise and vibration Abnormal temperature	Inclusion of dust and other foreign matter, indent on raceway surface, over-clearance, inadequate lubrication Use of improper lubricant, imperfect installation, under-clearance

**10.4 Bearing removal (dismounting)**

Some related bearings are removed from each shaft, incurred by periodic disassembly or incidental trouble of a machine. In this case, these bearings must be handled with good care similarly to the case of installation, when they are reused or the condition thereof is examined after removed (dismounted). Too tight fit of a bearing would incur difficulty in dismounting and, therefore, the bearing-related construction must be fully considered in design of

the bearing fixing method.

Regarding the dismounting method, generally the press method (Fig. 10.4) and the puller method (Fig.10.5) are available for dismounting inner ring though depending on bearing type and fitting conditions.

When inner ring is dismounted from a shaft by heating, good care must be exercised not to over-heat the inner ring.

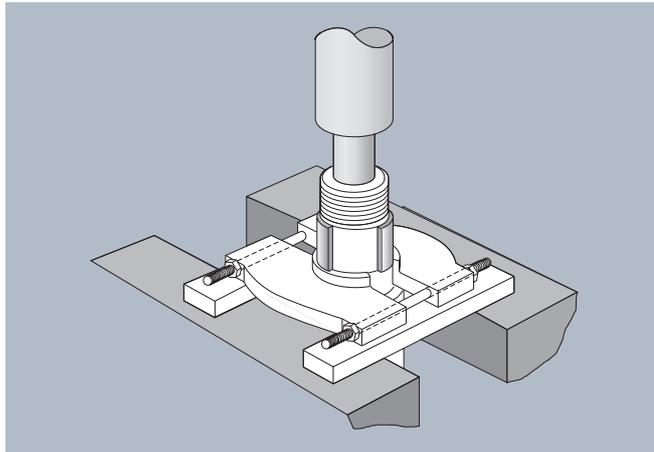

Fig. 10.4 Bearing removal by a press machine

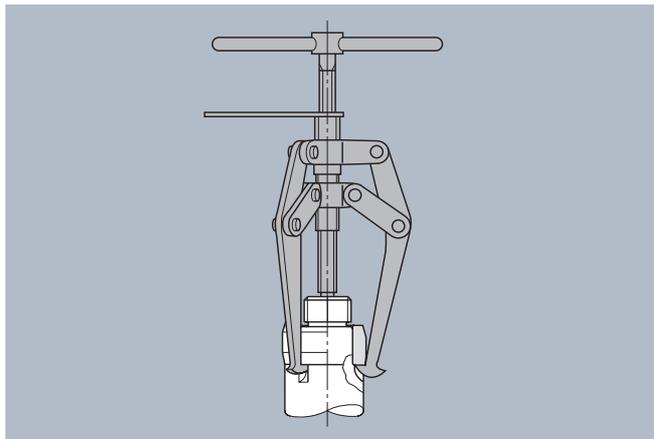

Fig. 10.5 Bearing removal by a puller

**10.5 Force required for press-fit and pull-out**

The force required for press-fitting or pulling out inner ring on / from a shaft can be determined by formula (10.1).

$$K_a = f_k f_E \frac{d}{d+3} \Delta d_F \dots \dots \dots (10.1)$$

Where,

$K_a$  : Force required for press-fitting or pulling-out N (kgf)

$f_k$  : Resistance factor being determined by shaft to inner ring friction factor

For press-fitting..... 40 (4)

For pulling-out.....60 (6)

$f_E$  : Coefficient depending on inner ring dimension

$$f_E = B \left[ 1 - \left( \frac{d}{F_1} \right)^2 \right]$$

$B$  : Inner ring width mm

$d$  : Inner ring bore diameter mm

$F_1$  : Mean outer diameter of inner ring mm

$\Delta d_F$  : Apparent interference  $\mu\text{m}$

Actual press-fit force and pull-out force could eventually exceed the respective calculate value due to installing error. Hence, it is recommended to design the dismounting tools so as to have the strength (rigidity) resistible to a load 5 times as much as the calculated press-fit force and pull-out force.

**10.6 Washing**

Rotating a bearing with foreign matter adhered thereto could result in damage of the raceway surface, etc. Therefore, any dismounted bearing is usually washed by light oil or kerosene or the like for complete removal of foreign matter. In this case, two washing vessels must be used as follows; one for rough washing and another for finish washing. Rough washing is done for removal of oil and foreign matter from bearing, while finish washing is done for fine washing of the roughly-washed bearing. Further, any vessels used for washing must be provided with a steel net as the middle bottom above the vessel bottom, as illustrated in Fig. 10.6, to prevent the bearing from coming in direct contact with the vessel bottom.

Furthermore, rust preventive treatment must be applied to the washed bearing immediately after washing, to thereby protect it from a risk of corrosion.

In addition, the legal requirements as applicable (environmental preservation, industrial labor safety and health, etc.) and the washing specification submitted from a detergent manufacturer must be taken in consideration in washing.

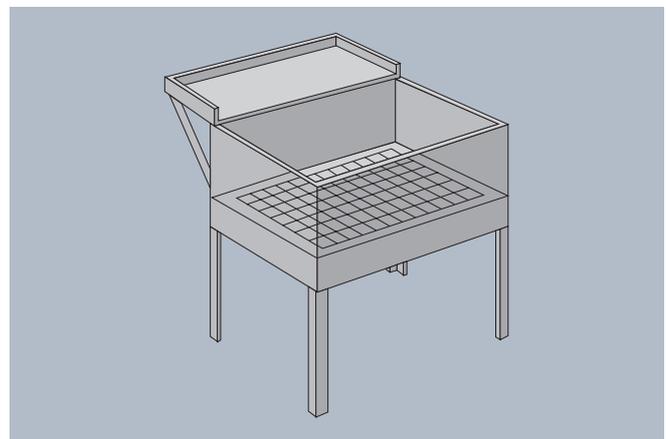

Fig. 10.6 Washing tank

## 11. Technical Data

### 11.1 HL Bearing

The form of bearing separation life can be mainly classified into the internal origin type and the surface origin type. Bearing separation of the surface origin type is said to occur in an inadequately lubricated area and it is widely recognized that the bearing separation life correlates to the oil film parameter that can be determined by "Elastic Fluid Lubrication Theory (EHL Theory)".

This oil film parameter must be increased for controlling the surface origin type separation and, for that, the bearing manufacturers have made possible effort for better improvement of lubricant and for upgrading of the bearing rolling raceway surface roughness.

In recent years it has been proposed by the relative field that the capability of forming an oil film on contact surfaces could be improved better by changing the form and directivity of surface roughness of machined parts.

On the other hand, NTN developed successfully long life HL (High Lubrication) bearings under "Micro EHL Theory" as one of the countermeasures against surface origin type separation. And these HL bearings have been widely used in each field since developed.

#### 11.1.1 Basic concept of HL bearing

Fig. 11.1 illustrates the basic concept of the HL bearing.

In this Figure, the hatched area shows a contact portion deformed elastically and the dotted line shows the lubrication flow, based on "Internal lubrication fluid flow model in contact portion" disclosed by H.S. Cheng and others.

Lubricant flow in (B) has a resistance greater than that in (A). This means that the quantity of a fluid existing internally in the contact portion increases. In other words, the thickness of an oil film formed on the rolling contact surface increases with increase of the fluid quantity.

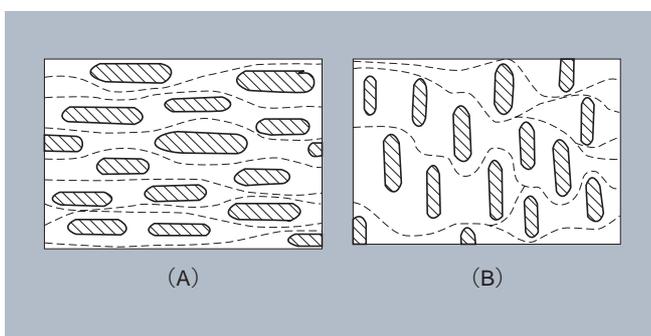

Fig. 11.1 Directivity of finished surface and lubrication fluid flow model

#### 11.1.2 HL surface

Fig. 11.2 is a magnified photo showing roller surface. In this Figure the blackened spots are micro recessed spots and, as seen from this Figure, a number of micro oil pots of around several tens μm exist at random. The recessed spots on this surface can be modified into any optional size and the number of spots by changing the machining conditions. Fig. 11.3 shows the bus line form of the HL surface, from which the depth of the micro recessed spots is nearly 1 μm.

#### 11.1.3 HL bearing application examples

The HL surface-treated bearings are widely used in various fields. For example, they are used for car transmission, hydraulic devices, various reduction gears, etc.

As an example of special application, HL surface treatment is applied to the special-purposed bearing for the rocker arm of car engine. This is highly appreciated as an effective seizure preventive measure.

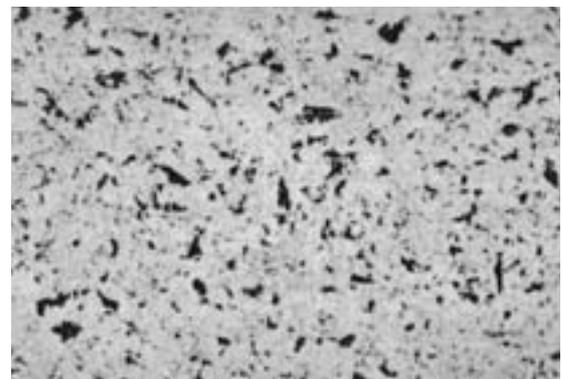

Fig. 11.2 Magnified photo showing roller surface

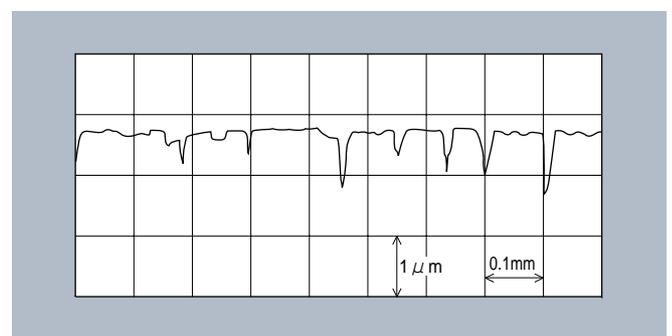

Fig. 11.3 Bus line form of HL surface

## 11.2 Bearings with Solid Grease

Bearings with Solid Grease means a bearing in which thermal solidification type grease (mainly composed of lubrication grease and resin) is filled as a lubricant material.

Once this thermal solidification type grease (referred to as Bearings with Solid Grease) was heated and cooled down (hereinafter referred to "heat treatment"), the paste-like grease hardens as much lubricant held unchanged.

The Bearings with Solid Grease is solidified after heat treatment so that the lubricant does not leak easily even in the case wide amplitude vibration and strong centrifuge act on the bearing, thus contributing to prevention of lubricant leak and longer bearing life.

The spot pack specification in which Bearings with Solid Grease was packed at multiple points on the cage and the full pack specification in which Bearings with Solid Grease was nearly full-packed in the spacing volume of bearing are both available for the Bearings with Solid Grease. Further, the needle roller bearings are all based on the full pack specification.

### 11.2.1 Characteristics of Bearings with Solid Grease

#### (1) Less lubricant leak

Bearings with Solid Grease holds much lubricant internally in bearing because it is solidified after heat treatment. This lubricant is gradually fed onto the rolling surface by heat generating from the bearing and centrifuge, whereby lubricant leak is minimized. This serves to prevent the peripheral environment from being contaminated, comparing with general lubrication greases.

#### (2) Good lubricating characteristic

Even when wide amplitude vibration and strong centrifuge act on a bearing, lubricant does not leak easily and, in addition, Bearings with Solid Grease does not emulsify and flow out easily, because of its solid type, even in the case of water content inflow to bearing.

Thus, the lubricating characteristic is more excellent than general lubrication greases.

#### (3) Sealing effect

Bearings with Solid Grease acts as a preventive barrier against foreign matters (water content, dust, etc.) invading from outside, but does not function perfectly as a seal. Therefore, use of the contact type rubber seal (for deep groove ball bearing, bearing unit) or another seal (for other bearings) is recommended particularly when high sealing performance is required.

### 11.2.2 Attentive points in using Bearings with Solid Grease

- (1) The needle roller bearing dimension to accept Bearings with Solid Grease differs every each bearing type. Feel free to contact NTN for the detail.
- (2) The allowable temperature range is  $-20^{\circ}\text{C}$  to  $80^{\circ}\text{C}$ , but  $60^{\circ}\text{C}$  and less for continuous long term running. Fully note the operating temperature.
- (3) Allowable rotational speed  $F_w \cdot n$  value ( $F_w$  = inscribed circle diameter [mm])  $\times$  ( $n$  = operating rotational speed [r/min]) is differs from that in use of general grease and lubrication oil. Fully note this matter.  
Use any needle roller bearings on  $F_w \cdot n$  value = 30,000 and less.
- (4) For the bearings of the full pack specification, minimum load equivalent to at least around 1% of the basic dynamic load rating is needed for enabling the rolling elements to run without slipping.
- (5) Bearings with Solid Grease acts as a preventive barrier against foreign matter invading from outside, but does not function perfectly as a seal. Therefore, combined use of Bearings with Solid Grease and rubber seal is recommended particularly when high sealing performance is required.

### 11.2.3 Application examples of Bearings with Solid Grease bearings

- Bearing for the paper feeder of a printing machine
- Bearing for the mast roller guide of a forklift
- Support bearing for the swing arm of a two-wheeled car
- Bearing for a machine tool
- Guide bearing for the guide unit of a press machine
- Bearing for the link mechanism of an automatic loom
- Bearing for the conveyor guide of a food packaging machine

11.3 Calculation Examples

11.3.1 Shrinkage factor and post-installation clearance of drawn cup needle roller bearing

The recommended fit data for the standard bearings is as described in **Table 1** on page B-33. This paragraph describes hereunder the calculation methods to be used when the bearing fit conditions are reviewed in detail.

1) Calculation of bearing shrinkage factor

For the drawn cup bearings, the shrinkage factor is calculated using the following method.

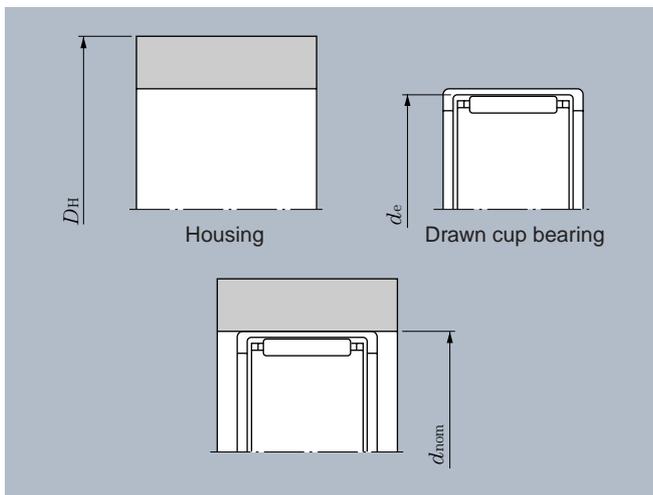

Fig. 11.4

$$\lambda = \frac{2t}{E_2} \cdot \frac{1-S^2}{\frac{(0.7S^2+1.3)(1-t^2)}{E_1} + \frac{(0.7+1.3t^2)(1-S^2)}{E_2}} \dots (11.1)$$

Where,

- $\lambda$  : Outer ring shrinkage factor
- $D_H$  : Housing outer diameter mm
- $d_{nom}$  : Nominal diameter of fitting portion mm
- $d_e$  : Rolling surface diameter of outer ring mm
- $E_1$  : Modulus of housing vertical elasticity (Young's modulus) MPa (kgf/mm<sup>2</sup>)
- $E_2$  : Modulus of outer ring vertical elasticity (Young's modulus) 2.07 × 10<sup>6</sup>MPa (21 200kgf/mm<sup>2</sup>)

$$S = \frac{d_{nom}}{D_H}$$

$$t = \frac{d_e}{d_{nom}}$$

2) Inscribed circle diameter after complete bearing fit in the housing on actual machine

[1] Inscribed circle diameter in press-fitting of master ring

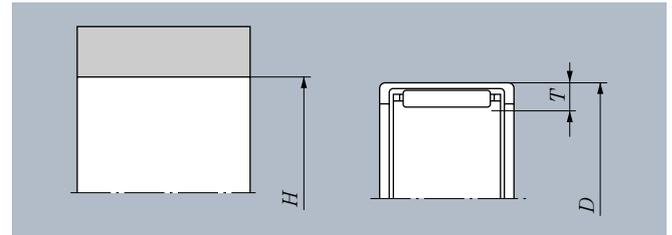

Fig. 11.5

- $H$  : Housing inner diameter mm
- $T$  : Roller diameter + plate thickness mm
- $D$  : Outer diameter of drawn cup needle roller bearing mm
- $L_i$  : Post press-fit inscribed circle diameter mm

When the master ring is press-fitted, the dimension of "roller diameter + plate thickness" remains unchanged. Hence, the inscribed circle diameter  $L_i$  is determined by the following formula.

$$L_i = D - 2T - \lambda(D - H) = (1 - \lambda)D - 2T + \lambda H \dots (11.2)$$

Determine the mean value of "roller diameter + plate thickness" (=T) and standard deviation from formula (11.2). The mean value of formula (11.2) is determined as follows.

$$m_{L_i} = (1 - \lambda) m_D - m_{2T} + \lambda m_H \dots (11.3)$$

Standard deviation of formula (11.2)

$$\sigma_{L_i2} = (1 - \lambda)_2 \cdot \sigma_{D2} + \sigma_{2T2} + \lambda_2 \sigma_{H2} \dots (11.4)$$

In the case of master ring, due to  $\sigma_{H2} = 0$  the formula (11.4) is expressed as follows.

$$\sigma_{L_i2} = (1 - \lambda)_2 \cdot \sigma_{D2} + \sigma_{2T2} \dots (11.5)$$

The unknown values in formulas (11.3), (11.5) are only  $m_{2T}$  and  $\sigma_{2T^2}$ . Hence, substitute the known numerical values for formulas (11.3), (11.5) to determine  $m_{2T}$  and  $\sigma_{2T^2}$ .

[2] Even when bearing ring is press-fitted in the housing on actual machine, consider the inscribed circle diameter similarly to the master ring press-fit. Herein, the calculation formulas for press-fit in the housing on actual machine can be discriminated as follows from formula (11.3), (11.4) by adding " ' " to each formula.

$$m_{L_i'} = (1 - \lambda') m_D - m_{2T'} + \lambda' m_H \dots (11.6)$$

$$\sigma_{L_i'2} = (1 - \lambda')_2 \cdot \sigma_{D2} + \sigma_{2T'2} + \lambda'_2 \sigma_{H'2} \dots (11.7)$$

[3] For  $m_{2T}$  and  $\sigma_{2T^2}$  in formula (11.6), (11.7), substitute the values determined previously for the respective formula.

[4] From the calculations, the inscribed circle diameter in press-fitting in the housing on actual machine can be

expressed in the following formula

$$L_i' = m L_i \pm 3 \sigma L_i' \dots\dots\dots(11.8)$$

[5] Radial internal clearance can be determined considering the mean value and standard deviation of shaft in formulas (11.6), (11.7).

[6] The aiming radial internal clearance value is generally set up so an ordinary clearance can be got. However, the recommended clearance values are available every the individual portions in the case of bearing application to automobile. Feel free to contact NTN for the detail.

**11.3.2 Track load capacity of cam follower and roller follower**

The reference hardness (reference tensile stress) was set up from the relationship between the follower hardness and net tensile stress of the material and the track load capacity was determined

from the relationship of the setup reference stress to hertz stress.

How to set up the reference hardness (tensile stress) differs a little bit depending on each bearing manufacturer. Herein, the relevant Table appended to "JIS Handbook for Irons and Steels" was used as the hardness - tensile stress relationship.

(Approximate numerical value under JIS Z8413 Revised Conversion Table)  
For HRC40,  $\sigma = 1.245\text{MPa}$  (127kgf/mm<sup>2</sup>) was adopted as the reference hardness (tensile stress).

**<Track load capacity adjustment factor>**

The tensile stress strength of the follower material increases with increase of its hardness, and the track load capacity of the follower increases incurred by increase of the tensile strength strength. In this case, the load capacity increase rate can be determined by multiplying the track load capacity by applicable track load capacity adjustment factor shown in Table 11.1.

Note) The track load capacity determined herein is based on net tensile stress as the reference, not allowable hertz stress. Generally stress (specific stress) resulting in creep of follower material is greater than the tensile stress. Particularly in the case of static load, this track load capacity comes to a safety side value.

[Ex.] Determination of load capacity  $T_c'$  of track with certain hardness by use of track load capacity adjustment factor.

Assuming track load capacity described in Dimensions Table as  $T_c$  and track load capacity adjustment factor at applicable hardness as  $G$  respectively, the track load capacity  $T_c'$  can be determined as follows.

$$T_c' = G \cdot T_c$$

For hardness HRC50 at NATR15X,  
 $T_c = 11\,900\text{N}$  (1 220kgf),  $G = 1.987$   
 $\therefore T_c' = 1.987 \times 11\,900\text{N}$  (1 220kgf)  
 $= 23\,645\text{N}$  (2 424kgf)

**Reference (Track load capacity calculation process)**

• For a cylindrical outer ring

$$\sigma_{\max} = \frac{1}{60.9} \sqrt{\frac{T_c \Sigma \rho}{B_{\text{eff}}}}$$

• For spherical R outer

$$\sigma_{\max} = \frac{187}{\mu \nu} \sqrt[3]{(\Sigma \rho)^2 T_c}$$

$\sigma_{\max} = 1\,245\text{MPa}$  (127kgf/mm<sup>2</sup>)  
 $T_c$  : Track load capacity N (kgf)  
 $\Sigma \rho$  : Sum of curvature  
 $B_{\text{eff}}$  : Effective contact length mm  
Herein (Outer ring width - chamfer)  
 $\mu \nu$  : Factor being determined by curvature

**Table 11.1 Track load capacity adjustment factor**

Hardness HRC	Tensile strength MPa {kgf/mm <sup>2</sup> }	Adjustment factor $G$	
		for cylindrical outer ring	for spherical R outer ring

### 11.3.3 Outer ring strength

Generally any outer ring never breaks down as long as the load acting it is a usual operating load. This paragraph describes hereunder the strength calculation method to be used when the outer ring strength under shock load and heavy load is reviewed.

The outer ring strength can be determined using the formula given hereunder, assuming the respective outer ring profiles as illustrated in **Fig. 11.6**. In this case, the outer ring rupture strength means the bridged rupture strength of roller.

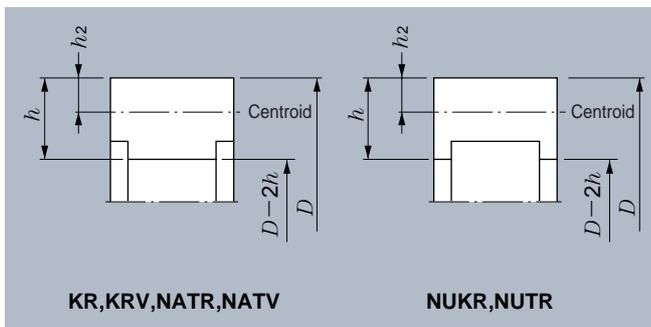

Fig. 11.6

Regarding how to set up breaking stress, in general 1760MPa (180kg/mm<sup>2</sup>) can be set up as the breaking stress for bearing steel, but it is desirable to set up the breaking strength with safety-side value (1170MPa [120kgf/mm<sup>2</sup>]), where stress concentration is taken into account. Generally any outer ring never break down as long as the load acting on it is usual operating load, but it necessary to check the rupture structure of outer ring, where shock load and heavy load act on it.

$$P = \frac{4\pi}{1+f(\alpha)} \times \frac{D-2h}{h(D-2h)^2} \times I \times \sigma$$

Where,

$$f(\alpha) = \frac{(\pi - \alpha) \sin \alpha - (1 + \cos \alpha)}{2 \cos \alpha}$$

$$\alpha = \frac{\pi}{Z} \text{ (rad.)}$$

- P : Breaking load (N)
- I : Secondary moment of outer ring section (mm<sup>4</sup>)
- Z : Number of rollers
- σ = Breaking stress (MPa)
- D, h, h<sub>2</sub> : per **Fig. 11.6** (mm)

### 11.3.4 Stud strength of cam follower

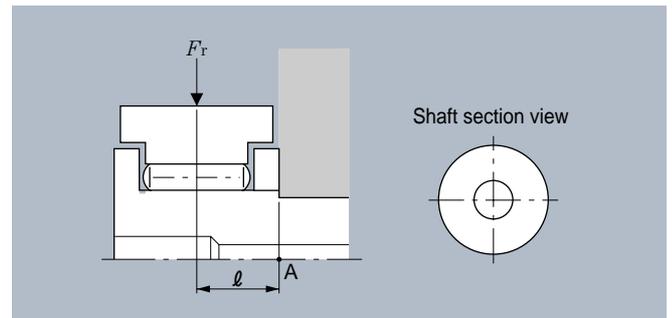

Fig. 11.7

When load Fr acts on the center point of outer ring as illustrated in **Fig.11.7**, bending moment Fr · l generates and consequently bending stress σ<sub>1</sub> (deemed as tensile stress) acts on the stud surface. In addition to this bending stress, tensile stress σ<sub>2</sub> generates from screw tightening because the stud itself is clamped to machine body with nuts. The stud strength can be reviewed from comparison of the sum (σ<sub>1</sub> + σ<sub>2</sub>) of these two tensile stresses with allowable stress σ for the stud material.

$$\sigma_1 + \sigma_2 < \sigma$$

$$\sigma_1 = \frac{F_r \cdot l}{Z} \quad \begin{array}{l} F_r : \text{Maximum radial load} \\ Z : \text{Coefficient of shaft section through Point-A} \end{array}$$

$$\sigma_2 \doteq 98\text{MPa (10kgf/mm}^2\text{)}$$

Tensile stress generating from maximum tightening torque described in "Dimensions Table"

σ : Allowable stress for material

The following values are adopted from the repeated bending test result of the stud material.

Where the stud material is subjected to static bending stress;

$$\sigma = 1372\text{MPa (140kgf/mm}^2\text{)}$$

Where the stud material is subjected to repeated bending stress (single direction)

$$\sigma = 784\text{MPa (80kgf/mm}^2\text{)}$$

Where the stud material is subjected to repeated bending stress (double directions)

$$\sigma = 392\text{MPa (40kgf/mm}^2\text{)}$$

Accordingly,

$$F_r < \frac{Z}{l} (\sigma - \sigma_2)$$

## 12. Bearing Type Symbols and Auxiliary Symbols

**Table 12.1 Bearing Type Symbols**

Type code	Bearing type
811	Single-direction thrust cylindrical roller bearing, dimension series 11
812	Single-direction thrust cylindrical roller bearing, dimension series 12
893	Single-direction thrust cylindrical roller bearing, dimension series 93
A	Needle roller, spherical type
AS11	Steel plate thrust washer, dimension series 11
ARN	Needle roller bearing with double-direction thrust cylindrical roller bearing
AXK11	Thrust needle roller bearing, dimension series 11
AXN	Needle roller bearing with double-direction thrust needle roller bearing
BF	Metallic flat cage for linear flat rollers
BK	Drawn cup needle roller bearing with close end
BR	Snap ring for bearing housing
CRV	Full complement roller for cam follower,
DCL	inch series Drawn cup needle roller bearing with open end, inch series
F	Needle roller, plane type
FF	Linear flat roller
FR	Bottom roller, for drawing frame (textile machine)
FRIS	Bottom roller
G	Synthetic rubber seal, one-lip type
GD	Synthetic rubber seal, double-lip type
GK	Needle rollers with split type cage
GS811	Outer ring for thrust bearing, dimension series 11
GS812	Outer ring for thrust bearing, dimension series 12
GS893	Outer ring for thrust bearing, dimension series 93
HCK	Drawn cup needle roller bearing for cross joint
HF	One-way clutch
HFL	One-way clutch integral with bearing
HK	Drawn cup needle roller bearing with open end
HMK	Drawn cup needle roller bearing with open end, for heavy load application
IR	Inner ring
JF · S	Arms for tension pulley and jockey pulley
JPU · S	Tension pulley and jockey pulley
K	Needle rollers with cage
K811	Thrust cylindrical roller, dimension series 11
K812	Thrust cylindrical roller, dimension series 12
K893	Thrust cylindrical roller, dimension series 93
KBK	Needle roller and cage assembly for small ends
KD	Linear ball bearing, stroking type
KH	Linear ball bearing, drawn cup type
KLM	Linear ball bearing, machined ring type
KLM · S	Linear ball bearing, clearance-adjustable type
KLM · P	Linear ball bearing, open type
KR	Cam follower
KRU	Cam follower, shaft eccentric type
KRV	Cam follower, full complement roller type
KRVU	Cam follower, full complement roller and shaft eccentric type

Type code	Bearing type
MI	Inner ring, inch series
MR	Machined ring needle roller bearing without inner ring, inch series
NA22	Roller follower with inner ring, dimension series 22
NA48	Machined ring needle roller bearing with inner ring, dimension series 48
NA49	Machined ring needle roller bearing with inner ring, dimension series 49
NA59	Machined ring needle roller bearing with inner ring, dimension series 59
NA69	Machined ring needle roller bearing with inner ring, dimension series 69
NA49 · S	Clearance-adjustable needle roller bearing with inner ring
NAO	Machined ring needle roller bearing, separable type, with inner ring
NATR	Roller follower
NATV	Roller follower, full complement roller type
NIP	Grease nipple
NK	Machined ring needle roller bearing without inner ring
NKIA59	Complex bearing : Needle roller bearing with angular ball bearing dimension series 59 Complex bearing
NKIB59	Needle roller bearing with three-point contact type ball bearing dimension series 59
NKX	Complex bearing : needle roller bearing with thrust ball bearing without dust-proof cover
NKX · Z	Complex bearing: Needle roller bearing with thrust ball bearing with dust-proof cover
NKXR	Complex bearing: Needle roller bearing with thrust cylindrical roller bearing without dust-proof cover
NKXR · Z	Complex bearing: Needle roller bearing with thrust cylindrical roller bearing with dust-proof cover
NUKR	Cam follower, full complement roller type
NUTR2	Roller follower, diameter series 2
NUTR33	Roller follower, diameter series 3
NUTW	Roller follower outer ring, middle rib type
PK	Needle roller and cage assembly
RF	Polyamide resin cage for linear flat rollers
RLM	Linear roller bearing
RNA22	Roller follower without inner ring, dimension series 22
RNA48	Machined ring needle roller bearing without inner ring, dimension series 48
RNA49	Machined ring needle roller bearing without inner ring, dimension series 49
RNA59	Machined ring needle roller bearing without inner ring, dimension series 59
RNA69	Machined ring needle roller bearing without inner ring, dimension series 69
RNA49 · S	Clearance-adjustable needle roller bearing, without inner ring
RNAB2	Open type roller follower without inner ring, diameter series 2
RNAO	Machined ring needle roller bearing, separable type, without inner ring
WR	Snap ring for shaft
WS811	Thrust inner ring, dimension series 11
WS812	Thrust inner ring, dimension series 12
WS893	Thrust inner ring, dimension series 93

**Table 1.2.2 Auxiliary symbols**

Symbol		Symbol representation	
Initial symbols	Material heat-treatment symbols	TS-	Bearing for high temperature application which was heat-treated for dimensional stabilization
		M-	Plated bearing
		E-	Bearing made of case-hardened steel
F-		Bearing made of stainless steel	
H-		Bearing made of high speed steel	
C-		Bearing made of carbon steel	
Expansion compensation	EC-	Expansion-compensated bearing	
Basic symbols			
Tail codes	Internal construction symbols	ZW	Double-row cage
		A,B,C	Internal construction change
	Cage symbols	J	Steel plate punched cage
		F1	Machined iron cage
		L1	High-strength yellow copper cage
		T2	Polyamide resin cage
		L3	Aluminum alloy cage
		L5	Sintered alloy cage
	S	Welded cage	
	Seal symbols	L,LL	With synthetic rubber seal
		P,PP	With plastic seal
	Bearing ring profile symbols	K	Bearing with 1/12 tapered bore
		N	Grooved snap ring
NR		With snap ring	
W		Bearing ring with notched knock hole	
D		With oil hole	
D1		With oil hole and oil groove	
H	Cam follower with hexagon hole		
Combination symbols	D2,Dn	Complex bearing using two or more same bearings	
	+α	With spacer	
	-P	Without cross roller stud	
Clearance symbols	C2	Clearance smaller than ordinary clearance	
	C3	Clearance larger than ordinary clearance	
	C4	Radial clearance larger than C3	
	NA	Non-interchangeable clearance	
Accuracy class symbols	P6	Bearing of JIS Class-6	
	P5	Bearing of JIS Class-5	
	P4	Bearing of JIS Class-4	
Lubrication symbols	/2A	SHELL ALVANIA Grease 2	
	/3A	SHELL ALVANIA Grease 3	
Special symbols	V1~Vn	Special specification, requirements

# Needle Roller and Cage Assemblies

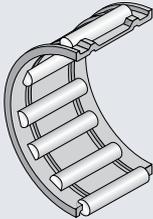

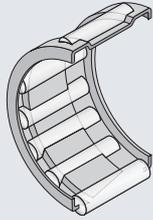

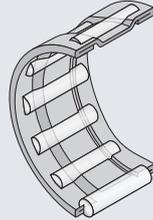

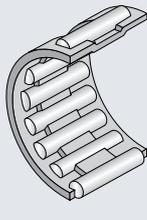

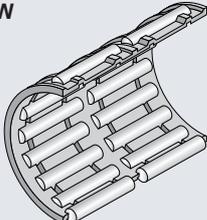

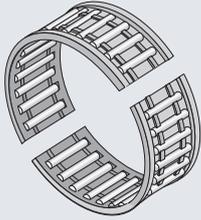

## Needle Roller and Cage Assemblies

This needle roller and cage assembly is one of the basic components for the needle roller bearing of a construction wherein the needle rollers are fitted with a cage so as not to separate from each other. The use of this roller and cage assembly enables to design a compact and lightweight construction by utilizing a shaft

or a housing as the direct raceway surface, without using inner ring and outer ring.

The needle rollers are guided by the cage more precisely than the full complement roller type, hence enabling high speed running of bearing. In addition, its rigidity and load capacity are high for the specific space.

Type of needle roller and cage assembly	Cage type	Applied shaft diameter (mm)	Composition of nominal bearing number	Nominal bearing number	Code items and respective dimensions
<b>K</b> (K·S) (K·T2) 	Machined ring type Polyamide resin type	$\phi 3 \sim \phi 285$	<b>K 20 × 24 × 10 S</b> ————— Tail code ————— Width ————— Roller set outer diameter ————— Inscribed circle diameter ————— Type code	K20×24×10S	Inscribed circle diameter : $\phi 20$ Roller set outer diameter : $\phi 24$ Width : 10 S : Welded type
	Welded type	$\phi 10 \sim \phi 100$			
<b>KMJ</b> (KMJ·S) (PCJ) 	Punched type	$\phi 15 \sim \phi 100$	<b>KMJ 20 × 26 × 13</b> ————— Width ————— Roller set outer diameter ————— Inscribed circle diameter ————— Type code	KMJ20×26×13	Inscribed circle diameter : $\phi 20$ Roller set outer diameter : $\phi 26$ Width : 13
	Welded type	$\phi 10 \sim \phi 40$			
<b>KJ·S</b> 	Welded type	$\phi 20 \sim \phi 40$	<b>KJ 30 × 35 × 17 S</b> ————— Tail code ————— Width ————— Roller set outer diameter ————— Inscribed circle diameter ————— Type code	KJ30×35×17S	Inscribed circle diameter : $\phi 30$ Roller set outer diameter : $\phi 35$ Width : 17 S : Welded type
<b>KV·S</b> 	Welded type	$\phi 7 \sim \phi 100$	<b>KV 30 × 35 × 17 S</b> ————— Tail code ————— Width ————— Roller set outer diameter ————— Inscribed circle diameter ————— Type code	KV30×35×17S	Inscribed circle diameter : $\phi 30$ Roller set outer diameter : $\phi 35$ Width : 17 S : Welded type
<b>K·ZW</b> 	Machined ring type	$\phi 8 \sim \phi 285$	<b>K 20 × 24 × 45 ZW</b> ————— Tail code ————— Width ————— Roller set outer diameter ————— Inscribed circle diameter ————— Type code	K20×24×45ZW	Inscribed circle diameter : $\phi 20$ Roller set outer diameter : $\phi 24$ Width : 45 ZW : Double-row type
<b>GK</b> 	Machined ring type Split type	$\phi 8 \sim \phi 285$	<b>GK 30 × 35 × 17</b> ————— Width ————— Roller set outer diameter ————— Inscribed circle diameter ————— Type code	GK30×35×17	Inscribed circle diameter : $\phi 30$ Roller set outer diameter : $\phi 35$ Width : 17

The ones with tail code T2 using polyamide resin cage shall be used at allowable temperature 120°C and, under continuous running, at 100°C or less.

The applied shaft diameter of welded type are described based on size that manufacturers can deal with a manufacturing. Therefore, it has nothing to do with the Demention Table.

## Inter-roller diameter deviation of needle rollers

Inter-roller diameter deviation of needle rollers which are built in one cage is within 2μm. The respective specified diameter tolerances for built-in needle rollers are identified by identification colors on the package label, as shown in **Table 1**.

The standard identification colors marked on each label are red, dark blue, blue, black and white, unless otherwise specially indicated.

Where two or more bearings are used in tandem, those of same identification color must be used for equal distribution of bearing load.

**Table 1** Color identification of diameter tolerances for needle roller bearings

Identification color on label	Diameter tolerance μm	Classification
Red	0~ - 2	Standard
Dark blue	-1~ - 3	
Blue	-2~ - 4	
Black	-3~ - 5	
White	-4~ - 6	
Gray	-5~ - 7	Semi-standard
Green	-6~ - 8	
Brown	-7~ - 9	
Yellow	-8~ - 10	

## Radial Clearance

When a shaft and a housing are used as the direct raceway surface, the radial clearance is determined by the shaft diameter and the housing hole dimension. Where the diameter tolerances for needle rollers are standard (tolerances color-identified in red, dark blue, blue, black, white), the shaft diameters and housing hole dimensions shown in **Table 2** are used.

**Table 2** Recommended fits

Shaft diameter mm		~80	80~140	140~
Radial clearance	Smaller than ordinary clearance	j5/G6	h5/G6	h5/G6
	Ordinary clearance	h5/G6	g5/G6	f5/H6
	Larger than ordinary clearance	g6/G6	f6/G6	f6/G6

## Shaft and housing specifications

Where a shaft and a housing are used as the direct raceway surface, the raceway surface must meet the specifications described in **Table 3**.

**Table 3** Shaft and housing specifications

Characteristics	Shaft	Housing
Roundness (max)	IT3	IT4
Cylindricity (max)	IT3	IT4
Surface roughness (max)	Refer to <b>Table 7.4</b> on page A-39.	
Surface hardness	HRC58~64	
Depth of hardened layer (min)	Refer to formula (7.1) on page A-39	

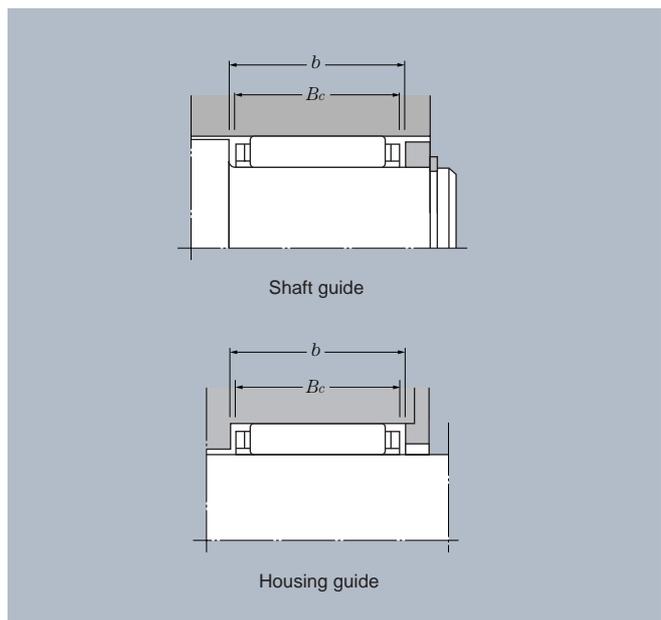

## Bearing installation related dimensions

The tolerances for the nominal dimension "Bc" of cage specified in **Table 4** are recommended as the guide width b of cage.

**Table 4** Guide width tolerances

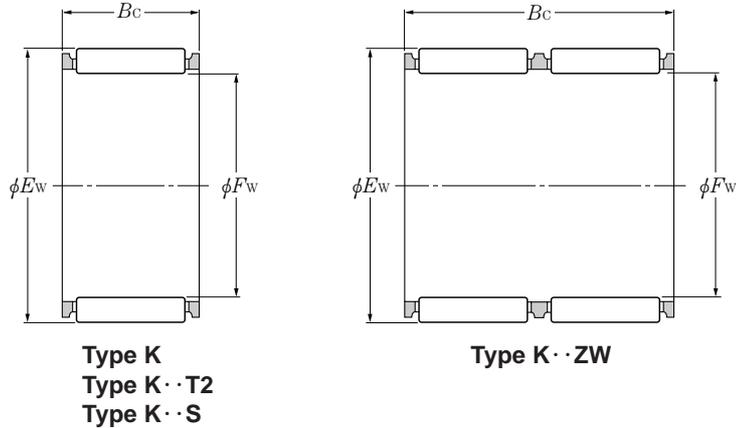

Unit : mm

Classification	Tolerances for guide width <i>b</i>	
	Single row	Double row
Metric system	$B_c \begin{smallmatrix} +0.2 \\ 0 \end{smallmatrix}$	$B_c \begin{smallmatrix} +0.3 \\ +0.1 \end{smallmatrix}$
Inch system	$B_c \begin{smallmatrix} \pm 0.4 \\ \pm 0.2 \end{smallmatrix}$	$B_c \begin{smallmatrix} \pm 0.5 \\ \pm 0.3 \end{smallmatrix}$

## Needle Roller and Cage Assemblies for connecting rod bearings

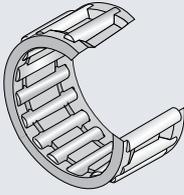

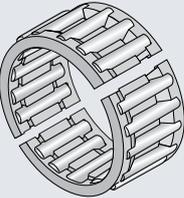

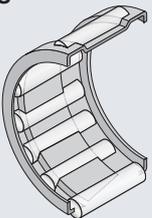

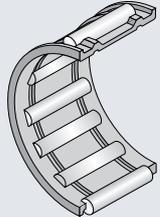

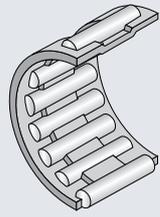

## Needle Roller and Cage Assemblies for connecting rod bearings

These needle roller and cage assemblies are specially designed so as to be adaptable to the operating environmental conditions for the connecting rods of small and medium reciprocal engines and compressors.

The connecting rods are used under a severe operating condition wherein acting load magnitude and

direction fluctuate rapidly as well as under an high temperature and strict lubrication environment. Therefore, special measures are mainly undertaken for the cage structure, material and machining method so that the needle roller and cage assemblies are resistible to the said operating condition and environment.

Type of needle roller and cage assembly	Location	Cage type	Applied shaft diameter (mm)	Composition of nominal bearing number
<b>PK</b> 	Large end side	Machined ring type	$\phi 10 \sim \phi 38$	<b>PK 20 × 26 × 13.8 × 1</b> Type code: PK Inscribed circle diameter: 20 Roller set outer diameter: 26 Width: 13.8 Tail code: 1

<b>KMJ · S</b> 	Small end side	Welded type	$\phi 10 \sim \phi 38$	<b>KMJ 10 × 14 × 8.8 S</b> Type code: KMJ Inscribed circle diameter: 10 Roller set outer diameter: 14 Width: 8.8 Tail code: S
<b>KBK</b> 				<b>KBK 14 × 18 × 17</b> Type code: KBK Inscribed circle diameter: 14 Roller set outer diameter: 18 Width: 17
<b>KV · S</b> 				<b>KV 8 × 11 × 8 S V4</b> Type code: KV Inscribed circle diameter: 8 Roller set outer diameter: 11 Width: 8 Tail code: S V4

Nominal bearing number	Code items and respective dimensions	Remarks
PK20×26×13.8X1	Inscribed circle diameter : $\phi$ 20 Roller set outer diameter : $\phi$ 26 Width : 13.8 X1 : numbering up	Cage intended to guide outer ring, eventually surface- treated by non-ferrous plating, etc.
GPK20× 26 × 13.8X	Inscribed circle diameter : $\phi$ 20 Roller set outer diameter : $\phi$ 26 Width : 13.8	Cage intended to guide outer ring, eventually surface- treated by non-ferrous plating, etc.  Can be applied to a crank of integral structure.
KMJ10×14×8.8S	Inscribed circle diameter : $\phi$ 10 Roller set outer diameter : $\phi$ 14 Width : 8.8 S : welded type	Cage intended to guide outer ring, eventually surface- treated by non-ferrous plating, etc.
KBK14×18×17	Inscribed circle diameter : $\phi$ 14 Roller set outer diameter : $\phi$ 18 Width : 17	Type KBK is intended to guide inner ring, which of the guide surface is designed as long as possible to thereby reduce the surface pressure. In addition, the roller length is so designed as to be maximum against the width of connecting rod, for high load capacity. On the other hand, Type V••S intended for outer ring guide needs a guide along the bore surface of connecting rod.
KV8×11×8SV4	Inscribed circle diameter : $\phi$ 8 Roller set outer diameter : $\phi$ 11 Width : 8 S : welded type V4 : numbering up	

**Radial clearance**

**Table 1** shows the recommended clearance values though the radial clearance differs depending on bearing clearance, load, revolutions and ambient temperature.

The proper radial clearance can be got by proper selection and combination of roller diameter, connecting rod hole diameter and pin diameter. **Table 2** shows the examples of selection and combination of those.

**Table 1 Recommended clearance values**

Unit :  $\mu\text{m}$

Pin diameter mm		Large end side	Small end side
Over	incl.		
6	10	9~23	5~17
10	18	10~24	5~17
18	30	10~24	5~17

**Connecting rod and pin specifications**

Connecting rod (bore surface), crank pin and piston pin (outer surface) can be used as direct raceway surface. However, these surfaces must be resistible to great load while maintaining high accuracy. For that, connecting rods and pins acting as the direct raceway surface must comply with the specifications specified hereunder.

Any connecting rods shall be made of cement steel, e.g. chrome molybdenum steel (SCM415, etc.), nickel chrome molybdenum steel (SNCM420, etc.) and any crank pins and piston pins shall also be made of cement steel, e.g. chrome steel (SCr420, etc.), all of which shall be surface-hardened by carburizing.

The surface hardness of each shall range from HRC58 to 64 and adequate depth of effective carburizing-hardened layer shall be secured up to Hv550. The depth of effective carburizing-hardened layer differs depending on actual load and pin diameter.

Feel free to contact NTN for the more detailed information.

The respective profile accuracy of connecting rod hole, crank and piston pin outer surfaces shall be as specified in **Table 3**.

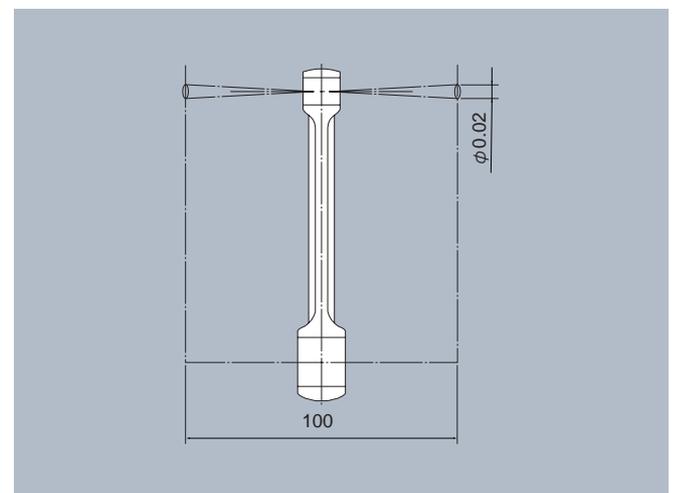

Furthermore, the parallelism of crank pin and piston pin shall be 0.02mm or less against 100mm. (**Fig. 1**)

The surface roughness shall be 0.2a for connecting rod and 0.1a for pin outer surface as a guideline.

**Table 3 Recommended accuracy of connecting rod and pin**

Unit :  $\mu\text{m}$

Parts	Characteristics	Pin diameter classification mm				
		~14	14~18	18~25	25~30	30~40
Connecting rod	Roundness (max)	3	4	4	5	5
	Cylindricity (max)	2	3	3	4	4
Pin	Roundness (max)	2	2	3	3	4
	Cylindricity (max)	1	1	2	2	3

**Fig. 1**

### Regulation to connecting rod

Two methods are available as follows to regulate axial motion of a connecting rod; one method is to make smaller a clearance between the rod and crank web at large end side (Method of regulating at large end side) and another method is to narrow a clearance between the rod and piston boss at the small end side (Method of regulating at small end side).

In general, the method of regulation at large end side is mostly adopted to get accurate motion of a connecting rod.

On the other hand, the method of regulation at small end side is adopted when regulation at large end side disables to secure good lubrication to the bearing and the guide surface at large end side due to short connecting rod and comparatively high revolutions.

#### Regulation at large end side

This method regulates axial motion of a connecting rod by forming a sliding surface between the large end of the connecting rod and the side face of crank web. For the use of this method, however, the connecting rod must be provided, on its bore surface, with oil hole, slot and oil groove to feed lubrication oil in and onto the bearing and guide surface at large end side.

The crank web end face shall be surface-hardened as necessary or otherwise a side washer of copper alloy or hardened steel shall be fitted on the guide surface.

On the other hand, the needle roller and cage assembly at small end side shall be guided in axial direction by the side face of piston boss. A great play shall be secured between the piston boss and the connecting rod.

#### Regulation at small end side

This method regulates axial motion at the small end face of a connecting rod and the side face of a piston rod. Generally a connecting rod is not provided with oil groove and slot to lubricate the guide surface at small end side, but on occasion it is surface-hardened and uses a side washer.

Usually a connecting rod shall be provided with a through-hole (at its small end side) to lubricate the bearing unit.

On the other hand, at the large end side a free clearance exists between the connecting rod and the crank web and, therefore, generally special measures such as oil groove to lubricate, etc.

may be omitted.

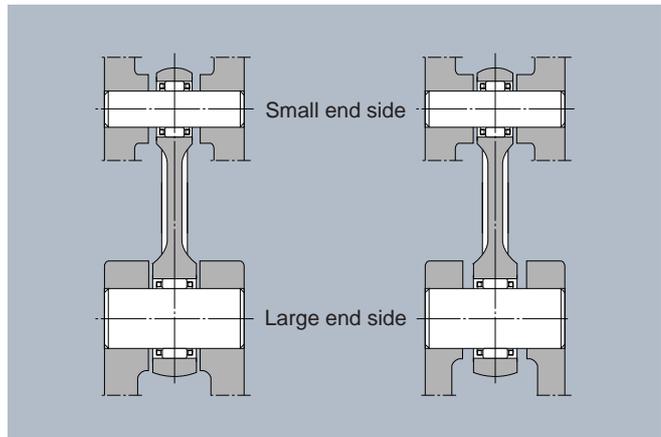

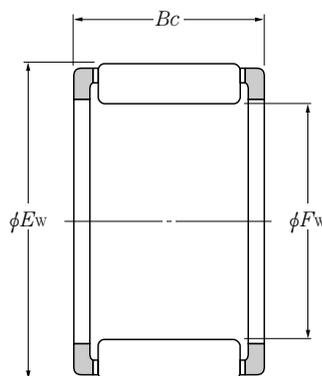

Fig. 2. Regulation at large end side Fig. 3 Regulation at small end side

## Drawn Cup Needle Roller Bearings

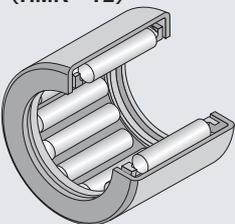

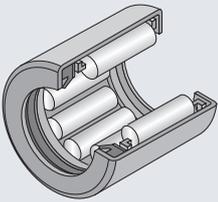

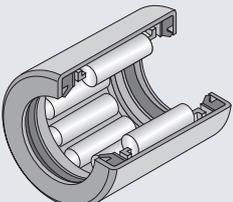

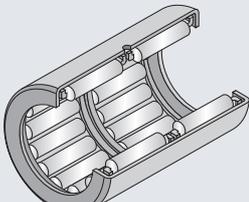

## Drawn Cup Needle Roller Bearings

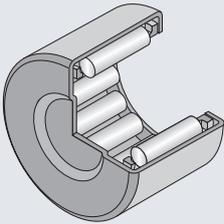

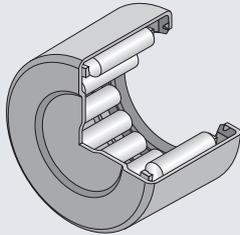

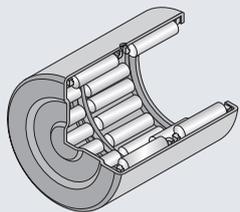

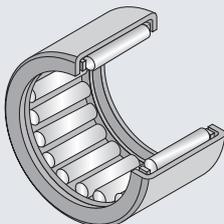

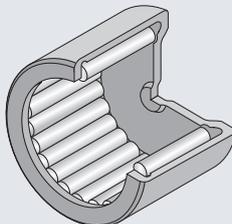

This bearing type is composed of an outer ring drawn from a thin steel plate by precision drawing, needle rollers and a cage assembled in the outer ring after the raceway surface thereof was hardened. Of the bearings with outer ring, this bearing type is a bearing with the smallest section height which enables space-saving and cost-saving.

Usually design is so made as to use a shaft as the direct raceway surface without using inner ring. The outer ring of this bearing type is of such a construction that the needle rollers and the cage are not separated from one another, so that the bearing is only press-fitted in a rigid housing with proper fit torque. Thus, this bearing type needs no snap ring, etc. to fix itself in axial direction and, in addition, is easy to handle.

Type of bearing	Applied shaft diameter (mm)	Composition of nominal bearing number	Nominal bearing number	Code items and dimensions	Remarks
<b>HK (HK·T2)</b> 	Open end $\phi 3 \sim \phi 50$	<b>HK 06 09 T2</b> Inscribed circle diameter Width Tail code Type code [Tail code] T2 : Resin cage C : Welding cage	HK0609T2	Inscribed circle diameter : $\phi 6$ Width : 9 T2 : Resin cage	The bearings with tail code T2 using polyamide resin cage shall be used at allowable temperature 120°C and, under continuous running, at 100°C and less.
<b>HK·L</b> 	Open end single side seal $\phi 12 \sim \phi 50$	<b>HK 20 18 L</b> Inscribed circle diameter Width Tail code Type code	HK2018L	Inscribed circle diameter : $\phi 20$ Width : 18 L : single side seal	This seal type (Tail code : L or LL) synthetic rubber seal built in at its single side or double sides is internally filled with lithium soap base grease. The operating temperature shall range from -25 to 100°C maximum to prevent deterioration of the seal and filled-up grease.  The roller length and rated load of this bearing type are shorter and smaller than those of the open type of same dimension.

## Bearing Fits

It is common that drawn cup needle bearing is press-fitted in a housing by shrinkage fit so post press-fit inscribed circle diameter ( $F_w$ ) comes to ISO Tolerance Rang Class F8. The post press-fit inscribed circle diameter ( $F_w$ ) depends on the housing material and rigidity. It is therefore desirable to decide the interference based on the data measured in pre-testing.

Where the housing rigidity is adequately high, the post press-fit inscribed circle diameter ( $F_w$ ) is secured in nearly F8 range and nearly ordinary radial clearance can be got by adopting the data of bearing fit in housing and on shaft as shown in **Table-1**.

**Table 1 Bearing fit in housing and on shaft**

Bearing type	Housing		Shaft	
	Iron series	Light alloy	Without inner ring	With inner ring
HK,BK	N6 (N7)	R6 (R7)	h5 (h6)	k5 (j6)
HMK,DCL	J6 (J7)	M6 (M7)		
HCK	F7	—	k6	—

## Accuracy of housing bore

Because of its thin-walled outer ring, the performance of drawn cup needle roller bearing is greatly affected by the dimensional accuracy, profile accuracy and bore surface roughness of a housing in which the bearing is press-fitted. To avoid such an inverse affect, the housing bore(hole) must have the accuracy as specified in **Table 2**. For the shaft accuracy refer to **Subsection 7.3 "Accuracy of Shaft and Housing"** (on page A-39).

**Table 2 Accuracy of housing bore**

Property	Tolerance
Roundness (Max)	IT4 or less
Cylindricity (Max)	IT4 or less
Surface roughness (Max)	1.6a

## Oil hole dimension in outer ring

The outer rings of double-row (Tail code : ZW) needle roller and cage assembly Type HK and Type BK are provided with an oil hole to facilitate oil lubrication to the bearing. **Table 3** shows the nominal oil hole diameter.

**Table 3 Diameter of oil hole in outer ring (Metric system)**

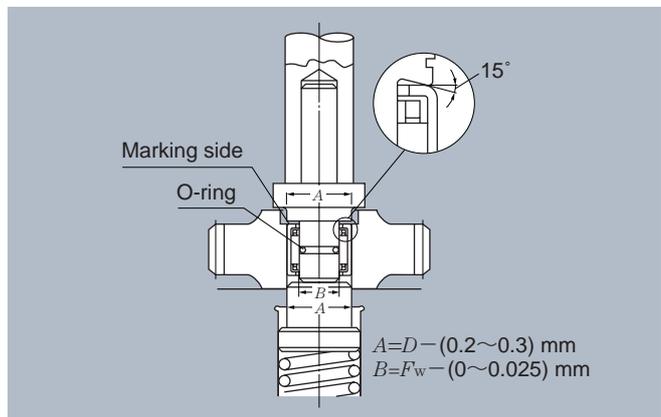

Outer ring diameter		Nominal oil hole diameter
Over	incl.	
5	10	1.5
10	20	2.0
20	40	2.5
40	80	3.0
80	200	3.5

## Bearing installation

Any drawn cup needle roller bearings must be press-fitted in the housing in specific position by holding a specific jig in perfect contact with the mark-stamped side face of the bearing, without fail.

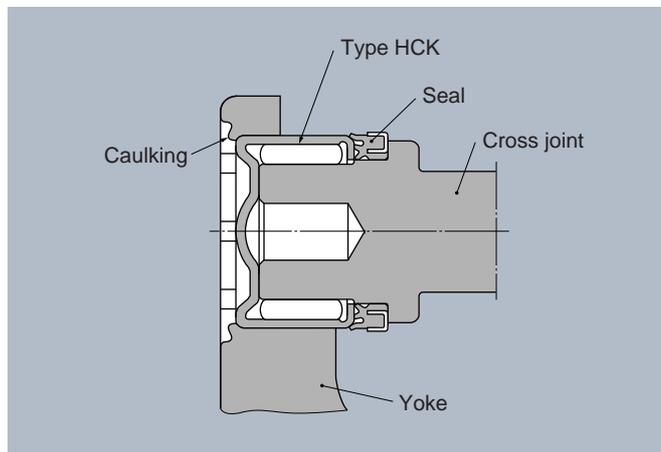

**Further, hammering directly the bearing ring in installing (press-fitting) is not allowed absolutely.** In installing, it is recommended to use a mandrel with O-ring as illustrated in **Fig.1** as a press-fitting jig. The use of this mandrel would enable to insert easily any drawn cup needle bearing in a housing without risk of twisting and fall-down.

Drawn cup needle roller bearing needs no a snap ring and a shoulder for positioning itself in a housing, **but the bearing must be press-fitted so carefully as not to allow its side face to strike the shoulder for preventing it from deforming, where press-fitted in a housing with shoulder.**

**Fig. 1**

The Type HCK for application to universal joints is fixed to the joint yoke by caulking, using a special-purposed assembler. Feel free to contact NTN for any inquiry about the special-purposed assembler (IPH Machine).

**Fig. 2**

## Bearing Tolerances and Measuring Methods

The outer ring of drawn cup needle roller bearing is so thin-walled that deformation thereof to a certain extent is unavoidable in the manufacturing processes, particularly in the heat-treating process. However, the outer ring is so designed that it is reformed normally from such deformation when being press-fitted in a housing with specific dimensional accuracy and, as a result, it can have the accuracy required to fulfill its specific function.

Hence, **it is meaningless to measure the dimensional accuracy of bearing itself before being press-fitted. So, the following measuring method is used; a bearing to be measured is press-fitted in a linkage of specific dimension (20mm or more in wall**

**thickness) and thereafter the inscribed circle diameter ( $F_w$ ) is measured using a plug gauge or a taper gauge to evaluate the bearing accuracy.**

Tables 4 to 7 show the dimensional tolerances for the bore diameter of each ring gauge and the inscribed circle diameter ( $F_w$ ) each of standard metric series drawn cup needle roller bearings Type HK and BK, heavy load series Type HMK (metric series), inch series Type DCL, and inch series HCK for application to universal joints. When measuring the inscribed circle diameter of roller, the low tolerance for the inscribed circle diameter shall be applied to the dimension at "GO" side and the value of the high tolerance for the inscribed circle diameter plus (+)  $2\mu\text{m}$  shall be applied to the dimension at "NOT GO" side in compliance with the relevant ISO standard.

## Machined Ring Needle Roller Bearings

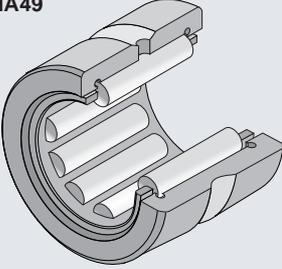

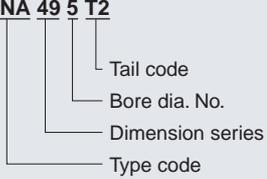

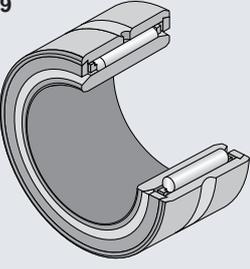

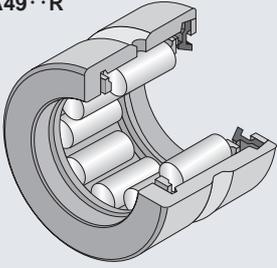

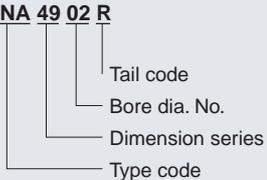

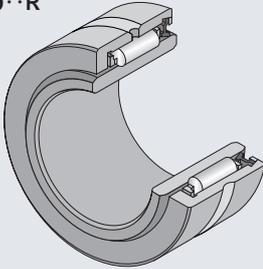

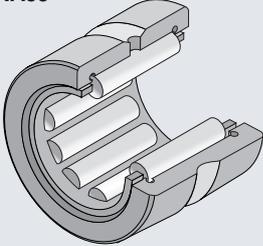

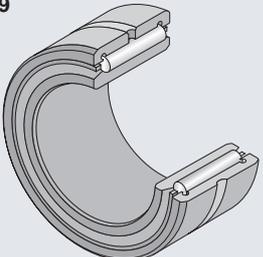

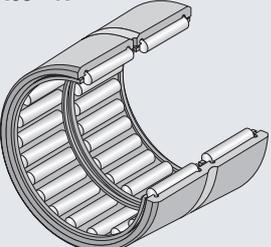

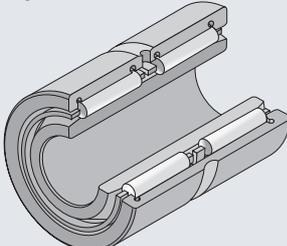

## Machined Ring Needle Roller Bearings

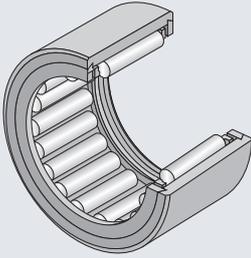

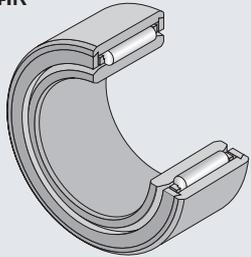

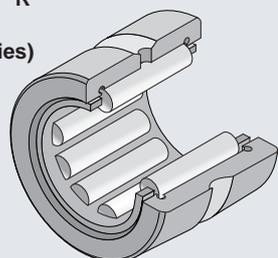

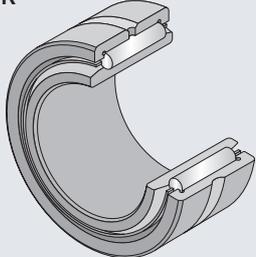

The machined ring of this bearing type contains needle rollers and a cage. And the outer ring and the needle rollers are inseparable from each other by means of double-side ribs on the outer ring or side plates.

Because of its machined (solid) outer ring enabling to make it more rigid and to thereby upgrade the bearing accuracy, this bearing type is suitable for an application

requiring high speed, high load and high running accuracy. These machined ring needle roller bearings are available in two types -- one without inner ring and another with inner ring -- considering the case of using a shaft as the direct raceway surface without using inner ring.

Bearing type	Applied shaft diameter (mm)	Composition of nominal bearing number	Remarks
<b>Type RNA49</b> 	$\phi 7 \sim \phi 12$	<b>RNA 49 5 T2</b> 	Bearing with tail code T2 uses a polyamide resin cage and, therefore, it shall be used at allowable temperature 120°C and, under continuous running, at 100°C and less.
<b>Type NA49</b> 	$\phi 5 \sim \phi 9$	<b>[Tail code]</b> T2: Resin cage	The dimension series is in compliance with JIS B 1512 or ISO 15.

## Bearing Tolerances

The dimensional accuracy, profile accuracy and running accuracy of machined ring needle roller bearings are specified in JIS B 1514 (Accuracy of Rolling Bearings). (Refer to Section 4 "Bearing Tolerances", **Table 4.3** on page A-26.) Although the accuracy of NTN standard bearings conforms to JIS Class-0, NTN can also supply bearings conforming to JIS Class-6, -5 and -4.

Feel free to contact NTN for the further detail of these bearings.

The dimensional tolerances for the roller inscribed circle diameters ( $F_w$ ) of bearing **type NK, RNA** and **MR** conform to ISO Tolerance Range Class-F6. Refer to this ISO Tolerance Class

in selecting shaft diameter and radial clearance.

## Radial clearance and bearing fits

NTN machined ring needle roller bearings (with inner ring) are all manufactured within the radial clearance range specified in **Table 5.1** of Subsection 5.1 "Radial Clearance in Bearings" (page A-30). Because of the narrow non-interchangeable clearance range, the bearings shipped after adjusted to a specific non-interchangeable clearance must be installed with the clearance remained unchanged.

The respective dimensional tolerances for shaft and housing bore sizes on/in which bearing with inner ring is press-fitted are per **Table 6.3** of 6.4 "Recommended Bearing Fits" (page A-34) which specifies them according to load characteristic, load magnitude, and shaft and housing bore sizes. The profile accuracy and

surface roughness of shaft and housing to be applied are as specified in **Table 7.3** of 7.3 "Shaft and Housing Accuracy" (page A-39).

A shaft is used as the direct raceway surface for a bearing without inner ring and, in this case, the shaft diameter (raceway diameter) tolerance is per **Table 1** specifying the tolerances according to each running clearance. And K7 tolerance generally in broad use is applied as the dimensional tolerance for the housing bore. Feel free to contact **NTN** for application of housing bore tolerance other than K7.

For the profile accuracy, surface roughness and hardness of a shaft acting as the raceway surface, refer to **Table 7.4** of 7.4 "Raceway Surface Accuracy"(page A-39).

**Table 1 Shaft diameter (raceway diameter) tolerance**

Roller inscribed circle dia. $F_w$ mm		Tolerance range class for shaft		
Over	incl.	Smaller than ordinary clearance	Ordinary class	Larger than ordinary clearance
	80	k5	h5	f6
80	160	k5	g5	f6
160	180	k5	g5	e6
180	200	j5	g5	e6
200	250	j5	f6	e6
250	315	h5	f6	e6
315	400	g5	f6	d6

### Dimension of oil hole in outer ring

The outer ring is provided with an oil hole and an oil groove to facilitate oil lubrication to bearing. (but excluding Type NK with roller inscribed circle diameter ( $F_w$ ) of 12mm and less.)

**Table 2** shows the oil hole dimension every outer ring diameter.

**Table 2 Oil hole dimension**

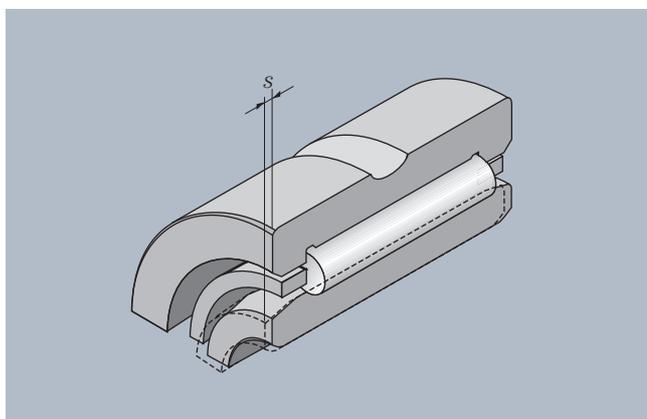

Outer ring outer diameter		Oil hole dia. (mm)	Number of oil hole
Over	incl.		
—	20	2.0	1
20	40	2.5	1
40	80	3.0	1
80	200	3.5	1
200	350	4.0	1
350	—	5.0	1

### Mounting relations

In the case of raceway with an oil hole, the bearing must be installed so the oil hole locates within the non-load area. In addition, any bearing with inner ring must be used within the allowable stroking value ( $s$ ) (with the rollers retained within the effective contact length range of inner ring).

For the allowable stroking value ( $s$ ), refer to Fig. 1 and applicable "Dimensions Table".

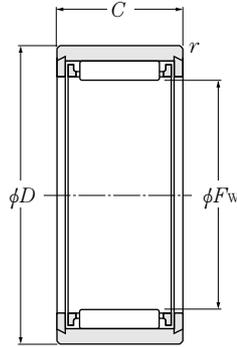

The inner ring and outer ring of machined ring needle roller bearing must be positioned in axial direction by shoulder or snap ring in this case. For the shoulder dimension and corner roundness ( $r_a$ ) of the shaft and the housing are as specified in applicable "Dimensions Table".

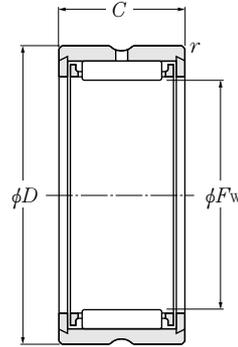

**Fig. 1**

Note 1) Allowable minimum chamfer dimension  $r$ . 2) Allowable axial stroking value of inner ring against outer ring.  
 Remarks: Nominal code number of inner ring (IR) comprises the codes of IR bore diameter×outer diameter×width.

Note 1) Allowable minimum chamfer dimension  $r$ . 2) Allowable axial stroking value of inner ring against outer ring.  
Remarks: Nominal code number of inner ring (IR) comprises the codes of IR bore diameter × outer diameter × width.

## Machined Ring Needle Roller Bearings, Separable Type

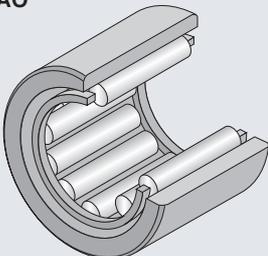

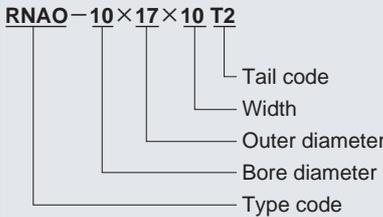

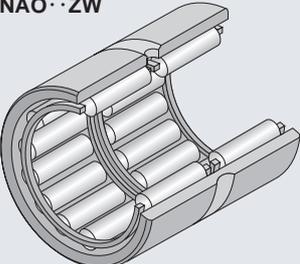

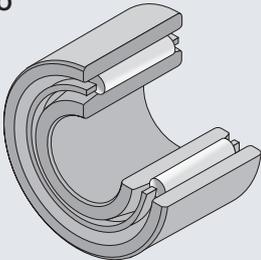

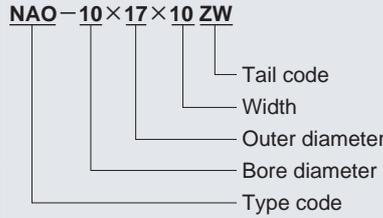

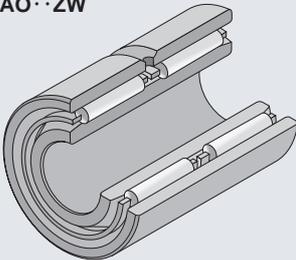

## Machined Ring Needle Roller Bearings, Separable Type

The machined ring of this bearing type has no rib or side plate and, hence, the outer ring and the needle roller and cage assembly are separable from each other.

The outer ring can't regulate axial displacement of the needle roller and cage assembly and, therefore, the bearing construction must be so designed that the needle roller and cage assembly can be guided by a shaft or a housing. Furthermore, the outer ring, the needle roller

and cage assembly separable from one another, and the inner ring can be press-fitted individually in a shaft or a housing. This could facilitate the bearing mounting work.

This bearing type is suitable for an application requiring high running accuracy because the resultant radial clearance can be retained in a narrow range by selection and combination of appropriate inner ring, outer ring and needle roller and cage assembly.

Bearing type	Applied shaft diameter (mm)	Composition of nominal bearing number	Remarks
<b>Type RNAO</b> 	$\phi 5 \sim \phi 100$	<b>RNAO-10×17×10 T2</b> 	
<b>Type RNAO · ZW</b> 	$\phi 8 \sim \phi 80$	<b>[Tail code]</b> T2 : Resin cage ZW: Double-row type	Bearing with tail code T2 uses a polyamide resin cage and, therefore, it shall be used at allowable temperature 120°C and, under continuous running, at 100°C and less.
<b>Type NAO</b> 	$\phi 8 \sim \phi 90$	<b>NAO-10×17×10 ZW</b> 	For an application requiring high running accuracy, manufacture of the bearings conforming to JIS Class-6, -5 and -4 is also available on special request.
<b>Type NAO · ZW</b> 	$\phi 10 \sim \phi 70$	<b>[Tail code]</b> T2 : Resin cage ZW: Double-row type	

### Accuracy of bearing

The dimensional accuracy, profile accuracy and running accuracy of machined ring needle roller bearing, separate type (with inner ring) are specified in JIS B 1514 (Accuracy of Rolling Bearings). (Refer to **Table 4.3** of Section 4. "Bearing Tolerances" on page A-26.) Although the accuracy of NTN standard bearings conforms to JIS Class-0, NTN can also supply bearings conforming to JIS Class-6, -5 and -4. Feel free to contact NTN for the further detail of these bearings.

The dimensional tolerances for the roller inscribed circle diameters ( $F_w$ ) of the bearing type without inner ring conform to ISO Tolerance Range Class-F6. The outer ring and the needle roller and cage assembly are supplied in set and, therefore, the bearing must be installed with the combination of these two in set remained unchanged.

Particularly when high bearing accuracy is required, a bearing with grinding allowance for its inner ring raceway surface can be supplied upon request from a client. In that case, however, the client is requested to finish the inner ring to the intended dimension after having installed on a shaft.

### Radial clearance and bearing fits

**Table 5.1** of Subsection 5.1 "Radial Clearance in Bearings" (page A-30) shows the radial clearance of bearings with inner ring. Because of the narrow non-interchangeable clearance range, the bearings shipped after adjusted to a specific non-interchangeable clearance must be installed with the clearance remained unchanged.

The respective fitting tolerances for shaft and housing bore on/in which bearing with inner ring is press-fitted are per **Table 6.3** of 6.4 "Recommended Bearing Fits" (page A-34) which specifies them according to load characteristic, load magnitude, and shaft and housing bore sizes.

The profile accuracy and surface roughness of shaft and housing to be applied are as specified in **Table 7.3** of 7.3 "Shaft and Housing Accuracy" (page A-39).

A shaft is used as the direct raceway surface for a bearing without inner ring and, in this case, the shaft diameter (raceway diameter) tolerance is per Table 1 specifying the tolerances according to each running clearance. And K7 tolerance generally in broad use is applied as the dimensional tolerance for the housing bore. Feel free to contact NTN for application of housing bore tolerance other than K7.

For the profile accuracy, surface roughness and hardness of a shaft acting as the raceway surface, refer to **Table 7.4** of 7.4 "Raceway Surface Accuracy" (page A-39).

### Dimension of oil hole in outer ring

The outer ring of bearing Type ZW is provided with an oil hole and an oil groove to facilitate oil lubrication to bearing.

**Table 1** shows the oil hole dimension every outer ring diameter.

**Table 1 Oil hole dimension**

Outer ring outer diameter		Oil hole dia. (mm)	Number of oil hole
over	incl.		
—	20	2.0	1
20	40	2.5	1
40	80	3.0	1
80	200	3.5	1

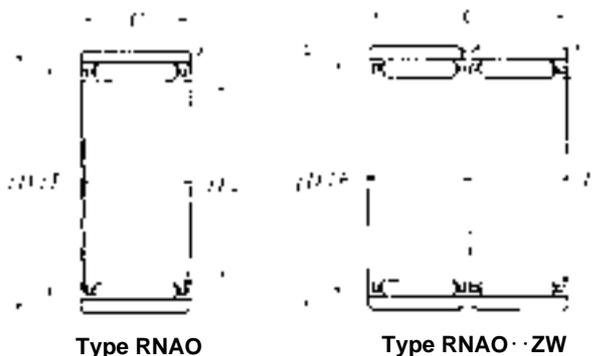

### Mounting relations

The inner ring and outer ring of any machined ring needle roller bearing, separable type must both be positioned in axial direction by shoulder or a snap ring.

For the shoulder dimension and corner roundness ( $r_a$ ) of the shaft and the housing are as specified in applicable "Dimensions Table". The cage must be guided by the shaft or the side face of the housing shoulder, but the guide surface must be finished by, at least, grinding for deburring.

# Inner Rings

## Inner Rings

### Inner Rings

Many of the needle roller bearings use a shaft as the direct raceway surface without using inner ring. However, it is recommended to use any of the inner rings described hereunder, together with needle roller bearing, where applicable shaft can not be surface-hardened and surface-finished by grinding. Any inner rings are made of high carbon chrome bearing steel and finished by grinding after heat-treated.

It is desirable to use an inner ring of wide width, where the axial displacement of a shaft is great and also a seal is used at the outer side of bearing.

### Types and Designs

NTN inner rings are available in both of **IR type** with boundary dimensions of metric system and **MI type** with boundary dimensions of inch system. The both ends of inner ring raceway are chamfered in taper form to facilitate fitting of the inner ring. On the other hand, any inner rings with an asterisk ※-mark are fine-chamfered so as to allow greater axial displacement. In addition to these inner rings, manufacture of special inner ring type (with tail code: **D**) with oil hole on its center is also available.

Particularly where high running accuracy is required, on occasion the raceway surface of inner ring is finished by grinding after fitted on a shaft. In such a case, an inner ring with grinding allowance for its raceway can be supplied. Feel free to contact **NTN** for the detail of such an inner ring.

### Composition of nominal number

Nominal number comprises type code (**IR** or **MI**), dimension code [bore dia. ( $d$ ) $\times$ raceway dia. ( $F$ ) $\times$ width ( $B$ )] and tail code.

The dimension of inch series **MI** type is expressed at the unit of 1/16 inch.

### Dimensional accuracy for inner ring

The dimensional accuracy (bore diameter " $d$ ", width " $B$ " and chamfer dimension " $r_s$  min"), profile accuracy and running accuracy of the inner rings are as shown in **Tables 4.3** and 4.5 of Section 4 "**Bearing accuracy**" (page A-26). And the standard accuracy class of these items conforms to JIS Class-0, but other inner rings conforming to JIS Class-5 and -4 are also offerable on request.

For the dimensional tolerance for raceway diameter ( $F$ ) shown in applicable Dimension Table, the inner ring is finished so the radial clearance comes to ordinary clearance (refer to **Table 5.1** of 5.2 "**Running clearance**" (page A-30) when it is combined with needle rollers.

Feel free to contact **NTN** for use of an inner ring subjected to radial clearance other than ordinary clearance.

Note 1) Dimensional tolerance to secure ordinary clearance when any of these inner rings is combined with needle roller bearing with no inner ring.

2) Allowable minimum chamfer dimension *r*'.

Remarks: 1. Nominal number plus code "D" represents inner ring with oil hole.

2. Nominal number plus ※-mark represents inner ring with fine-chamfered outer surface.

## Adjustable-Clearance Needle Roller Bearings

## Clearance-Adjustable Needle Roller Bearings

This bearing type comprises a solid outer ring with special machined section and needle rollers and cage built in the outer ring. The outer ring, needle rollers and cage are inseparable from each other. The raceway diameter of the outer ring is shrunk and the roller inscribed circle diameter ( $F_w$ ) is reduced correspondingly by pressing the outer ring in axial direction.

The radial clearance is fine-adjustable by an load to be applied to the bearing in axial direction, that is, axial shrinkage of the outer ring. This bearing type is mainly applied to the work spindle of a machine tool etc. which require high running accuracy, whose accuracy class is JIS Class-4.

Bearing type	Applied shaft diameter (mm)	Composition of nominal bearing number	Remarks
<p><b>Type RNA49·S</b></p> 	$\phi 30 \sim \phi 125$	<p><b>RNA 49 05 S</b></p> <ul style="list-style-type: none"> <li>— Type code</li> <li>— Dimension series</li> <li>— Bore diameter number</li> <li>— Tail code</li> </ul>	<p>The dimensional accuracy, profile accuracy and running accuracy conform to JIS Class-4 so as to be available for applications requiring high running accuracy.</p> <p>Another inner ring type with grinding allowance for its raceway surface can also be supplied upon request.</p>
<p><b>Type NA49·S</b></p> 	$\phi 25 \sim \phi 110$	<p><b>[Tail code]</b> S: Clearance-adjustable type</p>	

### Bearing accuracy

Application of this bearing type is limited to the portions of a machine which require high running accuracy. Therefore, the dimensional accuracy, profile accuracy and running accuracy of this bearing type conform to JIS Class-4. Higher running accuracy can be achieved by finishing the inner ring raceway surface with grinding allowance by grinding, after the inner ring was press-fitted on a shaft. Feel free to contact NTN for the more detailed information.

### Radial clearance and bearing fits

The Type **NA49·S** with inner ring has a radial clearance smaller than the specific ordinary clearance, while the radial clearance of Type **RNA49·S** without inner ring is determined by shaft diameter being selected per applicable "Dimensions Table" which specifies the dimensional tolerances for the roller inscribed circle diameter ( $F_w$ ).

The outer ring must be fitted in a housing by "close fit" or "tight fit" (interference of approximately  $5 \mu\text{m}$ ) to shrink the raceway diameter by pressing the outer ring in axial direction.

Bearing fit on a shaft and in a housing shall be per **Table 1**.

**Table 1 Bearing fit in shaft and housing**

Bearing type	Shaft	Housing
RNA49·S	m5	K4
NA49·S	k5	

### Shaft and housing accuracy

This bearing type which is applied to the portions of a machine requiring high running accuracy is clamped with the outer ring inclination in installing restrained as less as possible. Therefore, the profile accuracy of the shaft and the housing must be made higher than that for general machined ring needle roller bearings. (**Table 2**)

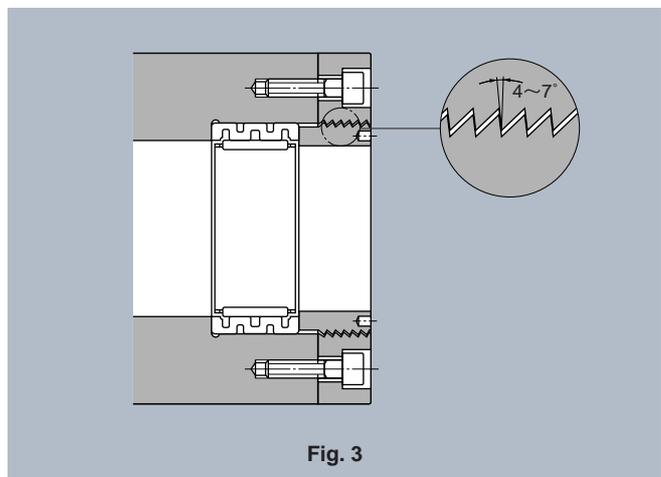

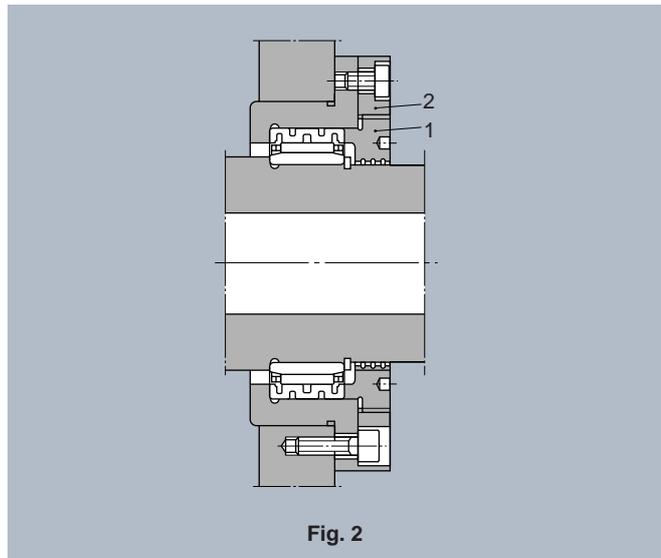

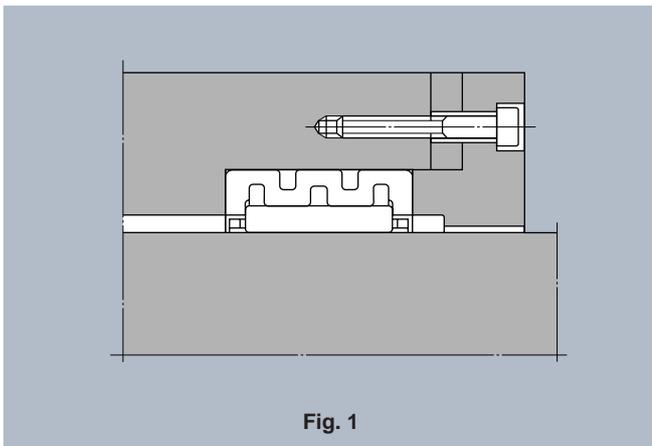

**Table 2 Shaft and housing accuracy**

Characteristics	Shaft	Housing
Roundness (max)	IT2	IT3
Cylindricity (max)	IT2	IT3
Shoulder perpendicularity (max)	IT3	IT3

### How to adjust radial clearance

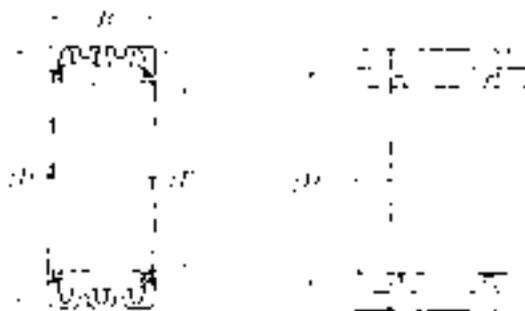

The ratio of outer ring axial shrinkage to shrinkage of roller inscribed circle diameter ( $F_w$ ) is nearly 3:1. In other words, the outer ring must be tightened by 3 mm in axial direction to make the radial clearance smaller by 1 mm.

For adjustment of the radial clearance, the outer ring must be tightened uniformly in parallel to the shaft center. In the case of adjustment by the method illustrated in **Fig.1**, a specific axial tightening value can be obtained by changing the thickness of a spacer, which was inserted between the housing and the lid, by lapping the spacer or replacing it with another spacer. In the case of adjustment by the method illustrated in **Fig.2**, the fixed ring 2 is fitted in the housing and, thereafter, the threaded lid 1 is screwed in until it comes in contact with the outer ring for zero setting. Then, the threaded lid 1 is further screwed in by the required value, after the fixed ring was loosened, and thereafter the fixed ring 2 is retightened. Further, it is recommended to use a saw-toothed tightening screw as illustrated in **Fig. 3** because accuracy-down can be minimized by use of such a screw.

## Without inner ring

# Complex Bearings

## Complex Bearings

NTN complex bearing is composed of a radial needle roller bearing to support radial load and a thrust ball bearing or a thrust roller bearing to support axial load which are integrated into one bearing unit. Comparing with individual use of a radial bearing and a thrust bearing

for the same purpose, this complex bearing saves the required installation space and thereby can contribute to making the overall construction of an equipment more compact.

Bearing type	Applied shaft diameter (mm)	Load capacity	Composition of nominal bearing number
<b>Type NKX</b> 	$\phi 10 \sim \phi 70$		<b>NKX 20 T2</b> Tail code T2: Resin cage Dimension code (shaft diameter) Type code
<b>Type NKX · Z</b> 			<b>NKX 20 T2 Z</b> Tail code T2: Resin cage Z: with dust-proof cover Dimension code (shaft diameter) Type code
<b>Type NKXR</b> 	$\phi 15 \sim \phi 50$		<b>NKXR 20 T2</b> Tail code T2: Resin cage Dimension code (shaft diameter) Type code
<b>Type NKXR · Z</b> 			<b>NKXR 20 T2Z</b> Tail code T2: Resin cage Z: with dust-proof cover Dimension code (shaft diameter) Type code
<b>Type NKIA</b> 	$\phi 15 \sim \phi 70$		<b>NKIA 59 04</b> Bore diameter code Dimension series code Type code
<b>Type NKIB</b> 	$\phi 15 \sim \phi 70$		<b>NKIB 59 04 R</b> Tail code R: outer ring with rib Bore diameter code Dimension series code Type code
<b>Type AXN</b> 	$\phi 20 \sim \phi 50$		<b>AXN 20 52</b> Outer diameter code Bore diameter code Type code
<b>Type ARN</b> 	$\phi 20 \sim \phi 70$		<b>ARN 20 62</b> Outer diameter code Bore diameter code Type code

※Each listed load capacity is subject to reference bearing bore diameter of  $\phi 20$ .

Bearing components	Handling characteristic	Features
Inscribed circle diameter (shaft dia.) : $\phi 20$ Radial bearing : Needle roller type Iron cage Thrust bearing : Ball type Resin cage Dust-proof cover : without Thrust plate : Separable	 Separable thrust plate Without dust-proof cover	Can be applied to high speed running under light axial load, due to use of ball type thrust bearing.
Inscribed circle diameter (shaft dia.) : $\phi 20$ Radial bearing : Needle roller type Iron cage Thrust bearing : Ball type Resin cage Dust-proof cover : with Thrust plate : Non-separable, integral type	 Integral thrust plate With dust-proof cover	This type is identical to NKZ, but its thrust bearing is provided with dust-proof cover to prevent grease scattering. Furthermore, the handling characteristic is good because the dust-proof cover makes the thrust plate non-separable integral.
Inscribed circle diameter (shaft dia.) : $\phi 20$ Radial bearing : Needle roller type Iron cage Thrust bearing : Ball type Resin cage Dust-proof cover : without Thrust plate : Separable	 Separable thrust plate Without dust-proof cover	Due to the use of needle roller bearing as its thrust bearing, this type can support greater axial load than NKX.
Inscribed circle diameter (shaft dia.) : $\phi 20$ Radial bearing : Needle roller type Iron cage Thrust bearing : Ball type Resin cage Dust-proof cover : with Thrust plate : Non-separable, integral type	 Integral thrust plate With dust-proof cover	This type is identical to NKXR, but its thrust bearing is provided with dust-proof cover to prevent grease scattering. Furthermore, the handling characteristic is good because the dust-proof cover makes the thrust plate non-separable and integral.
Inscribed circle diameter (shaft dia.) : $\phi 20$ Radial bearing : Needle roller type Thrust bearing : Angular type	 Integral angular bearing Inner ring separable	This type is composed of needle roller bearing and angular bearing which were integrated into one unit. The angular bearing supports axial load. Hence, this type can support one-way axial load only. Best-suited to high speed and light load application.
Inscribed circle diameter (shaft dia.) : $\phi 20$ Radial bearing : Needle roller type Outer ring with rib Thrust bearing : Three-point contact angular type	 Double inner ring type Inner ring separable	This type is composed of needle roller bearing and three-point contact angular bearing which were integrated into one unit. Unlike KN1A, this type can support bi-directional axial load.
Inscribed circle diameter (shaft dia.) : $\phi 20$ Outer ring outer diameter : 52 Radial bearing : Needle roller type Thrust bearing : Needle roller type	 Separable	This type is a special-purposed bearing to support a precision ball screw. This type uses the side face of the radial bearing as the raceway surface of thrust bearing. This can support axial load from both directions.
Inscribed circle diameter (shaft dia.) : $\phi 20$ Outer ring outer diameter : 62 Radial bearing : Needle roller type Thrust bearing : Cylindrical roller type	 Separable	This type is a special-purposed bearing to support a precision ball screw. This can support bi-directional axial load. This type is identical to AXN, but its axial load capacity is greater.

### Bearing Accuracy

Regarding the dimensional tolerances for radial needle roller bearing, refer to **Table 4.3** of 4. "Bearing Tolerances" (page A-26) for others than the characteristics described in Dimensions Table and to **Table 4.4** (page A-26) for thrust bearing tolerances respectively. Manufacture of bearing **Type AXN** and **ARN** is limited to those of JIS accuracy class-5 and -4 only. (Allowable radial run-out values for Type AXN and ARN is as specified in **Table 1.**)

**Table 1 Allowable radial run-out values for Type AXN and ARN**  
Unit:  $\mu\text{m}$

Nominal bearing bore dia. $d$ or nominal bearing outer dia. $D$ (mm)		Radial runout of radial inner ring <sup>①</sup> $K_{ia}$		Allowable radial run-out for outer ring <sup>②</sup> $K_{ea}$	
Over	Incl.	Class 5	Class 4	Class 5	Class 4
18	30	4	3	—	—
30	50	5	4	—	—
50	80	5	4	8	5
80	120	—	—	10	6
120	150	—	—	11	7

- ① To be determined based on " $d$ ".
- ② To be determined based on " $D$ ".

### Radial clearance

The respective radial clearances of **Type NKX+IR**, **NKXR+IR**, **NKIA** and **NKIB** shall comply with the interchangeable clearances specified in **Table 5.1** (1) of 5.1 "Radial Clearances of Bearings" (page A-30). The standard bearings are manufactured subject to the regular clearances.

The radial clearances of **Type AXN** and **ARN** is special clearance, as specified in applicable Dimensions Table.

### Bearing fits

Radial needle roller bearings shall be fitted on shaft/in housing in compliance with **Table 2**. The thrust bearing washers of **Type NKX** and **NKXR** shall be fitted in a housing with hole diameter larger by 0.5mm or over than the washer outer diameter  $D_1$  or  $D_2$ . For **Type NKIA** and **NKIB** it is not allowed to make the interference greater than k5/M6.

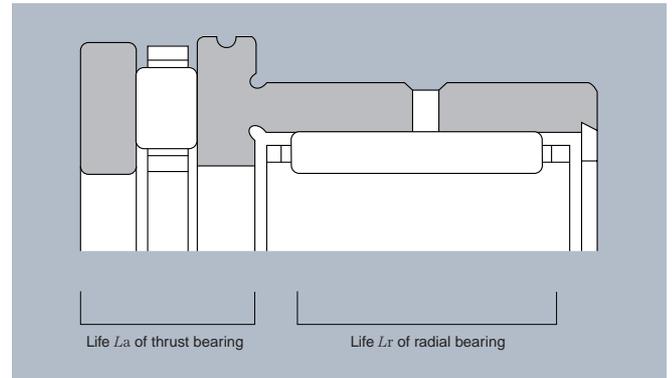

**Table 2 Bearing fit on shaft and in housing**

Bearing type	Shaft	Housing
Series NKX, NKXR	k5	K6 (M6)
Series NKIA, NKIB	k5	M6
Series AXN, ARN	j5	J6

Remarks: The parenthesized housing code is applied, where high rigidity is required.

### Calculation of rated life

The rated life ( $L$ ) of any complex bearing is determined as follows. Determine individually the rated life ( $L_r$ ) of radial needle roller bearing from radial load acting thereon and the rated life ( $L_a$ ) of thrust bearing from axial load acting thereon. And determine the rated life ( $L$ ) from these determined rated lives ( $L_r, L_a$ ) using the following formula

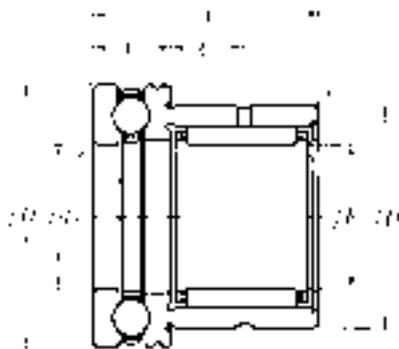

Rated life  $L$  of complex bearing

$$L = \frac{1}{\left(\frac{1}{L_r^{1.1}} + \frac{1}{L_a^{1.1}}\right)^{0.91}} \dots\dots\dots(1)$$

Note 1) Allowable minimum chamfer dimension  $r$ .

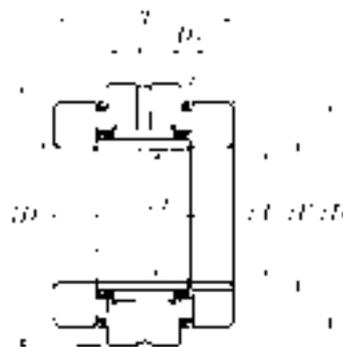

Remarks: 1. This complex can support bi-directional axial load.

2. The ball bearing of this complex bearing is complete with a synthetic resin cage, and the allowable operating temperature shall be 120°C and, under continuous running, 100°C or less.

3. This bearing type is the imported product from INA, Germany.

# Roller Followers / Cam Followers

## Roller Followers (Yoke Type Track Rollers)

NTN Yoke Type Track Rollers is the rolling mechanisms whose outer ring rolls on a track. For example, these track rollers are applied to eccentric roller, guide roller, rocker arm roller, cam roller and pressure roller. For that, the outer ring is designed to such a wall thickness as to be resistible to high load and shock load.

Both of spherical outer surface (rolling surface) and cylindrical outer surface are available for the outer ring. The spherical outer ring can damp edge-load acting on the contact surface between the track and the track roller, while the cylindrical outer ring (Tail code: **X**) has track load capacity greater than the spherical outer ring.

Bearing type	Applied shaft diameter (mm)	Load capacity	Composition of nominal bearing number
<b>RNA22</b> 	$\phi 6 \sim \phi 58$		<b>RNA 22 / 6 LL</b> Tail code LL: Seal Dimension code Dimension series code Type code
<b>NA22</b> 			<b>NA 22 06 X LL</b> Tail code LL: Seal Tail code X: Cylinder outer diameter Dimension code Dimension series code Type code
<b>NATR</b> 	$\phi 5 \sim \phi 50$		<b>NATR 30 X LL</b> Tail code LL: Seal Tail code X: Cylinder outer diameter Dimension code Type code
<b>NATV</b> 	$\phi 5 \sim \phi 50$		<b>NATV 25 LL</b> Tail code LL: Seal Dimension code Type code
<b>NACV</b> 	$\phi 6.35 \sim \phi 57.15$		<b>NACV 32 X LL</b> Tail code LL: Seal Tail code X: Cylinder outer diameter Dimension code Type code
<b>NUTR</b> 	$\phi 15 \sim \phi 50$		<b>NUTR 3 10</b> Dimension code Dimension series code Type code
<b>NUTW</b> 	$\phi 15 \sim \phi 50$		<b>NUTW 2 05 X</b> Tail code X: Cylinder outer diameter Dimension code Dimension series code Type code

Each listed load capacity is subject to reference bearing bore diameter of  $\phi 50$  or  $\phi 50.8$

### Bearing Tolerances

The respective dimensional accuracy, profile accuracy and running accuracy of the bearing bore diameter ( $d$ ), cylindrical roller outer diameter ( $D$ ), and outer ring width ( $C$ ) are as shown in **Table 4.3** of Section 4. "**Bearing Accuracy**" (page A-26). (Conforming to JIS Accuracy Class-0)

On the other hand, the dimensional tolerances for spherical roller outer diameter ( $D$ ) and the roller inscribed circle diameter ( $F_w$ ) of **Type RNA22** are as shown in applicable Dimensions Table.

### Bearing fits and radial clearance

The tolerance range class of shaft against bearing with inner ring shall be g6 (h6) and, where a shaft is used as the direct raceway surface (**Type RNA22**), the tolerance range class of the shaft shall be k5 (k6). In general, the outer ring is not fitted in a housing. Mounting relations

**Table 1 Radial clearances**

Unit:  $\mu\text{m}$

Nominal roller inscribed circle dia. $F_w$ (mm)		Clearance							
		C2		Ordinary		C3		C4	
over	Incl.	min	max	min	max	min	max	min	max
3	6	0	10	3	17	15	30	20	40
6	10	0	12	5	20	15	30	25	45
10	18	0	15	5	25	15	35	30	55
18	30	0	20	10	30	20	40	40	65
30	50	0	25	10	40	25	55	50	80
50	80	0	30	15	50	30	65	60	100
80	100	0	35	20	55	35	75	70	115

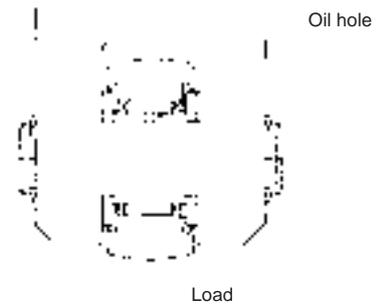

(1) The side face height in the roller follower mount must be made larger than "e" dimension described in applicable Dimensions Table. (**Fig.1**) In mounting, chamfer the mounting surface at R as small as possible (around  $0.5 \times 45^\circ$ ) and bring the inner ring and the end face of side plate in precise contact with one another.

**Fig.1**

(2) Where the roller follower is mounted, locate the inner ring oil hole within the non-load area (load free side). (**Fig. 2**)

If the oil hole locates within the load area, it would cause shorter life.

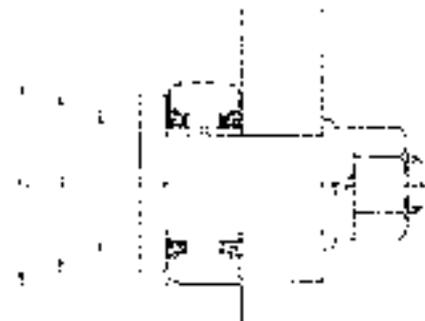

**Fig.2**

(3) **Type NA···22LL** and **RNA22** are of separable type and, hence, the outer ring is guided by flange or thrust washer mounted on shaft (pin). Therefore, the guide surface must be finished more precisely than by lathe-turning and deburred completely for surface smoothing. In addition, when the guide surface is not hardened the outer ring must be guided at  $A$ -dimension shown in **Fig.3**. When it is hardened, even a little smaller guide surface can be used.

$$A \geq \frac{1}{2}(D+e)$$

For  $D$  and  $e$  dimensions refer to applicable Dimensions Table.

**Fig.3**

In assembling this bearing, it must be handled with good care to protect the seal lip from bending and flaw.

**Where any of NTN roller followers was stub-mounted, non-uniform load (bias load) could act on the bearing, inversely affected by fitting loose arising from further continued running. Good care must be exercised of such fitting loose, for stable running of the equipment.**

## Lubrication

The roller followers with synthetic rubber seal (with tail code : **LL**) and the full complement roller type followers are filled up with lithium soap base grease so that they can be used in the temperature range of -25 to +100°C. Lubricant feeding and replenishing into the bearing are done through an oil hole provided on the inner ring. In this case, the inner ring must be fitted so the oil hole locates within non-load area. For the full complement roller type roller followers **NATV**, **NACV**, **NUTR** and **NUTW** with no cage, it is necessary to shorten the grease replenishing interval.

Further, a roller follower with cage and without seal is not filled up with lubrication grease. When needing a follower with grease-filled cage, feel free to contact **NTN**.

**The outer ring outer surface of bearing and the track surface must both be lubricated. Failure to lubricate could result earlier in damage of the bearing.**

## Track load capacity

Statically allowable maximum radial load on the contact surface of track to track roller is referred to as "track load capacity", which differs depending on the track hardness. The track load capacity described in applicable Dimensions Table is subject to track hardness HRC40. If the hardness value is other than HRC40, multiply the track load capacity in the Dimensions Table by the adjustment factor *G* in **Table 2**, for determining the track load capacity. However, the track load capacity shall be  $C_{0r}$  if the calculated track load capacity exceeds the basic static load rating  $C_{0r}$  of bearing.

Refer to page A-55 for the detail.

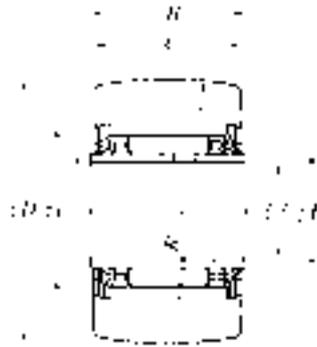

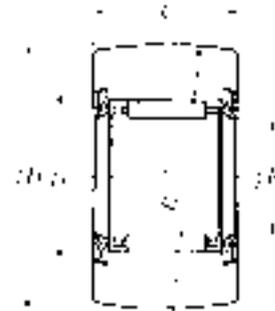

**Table 2 Adjustment factor *G***

Hardness HRC	Adjustment factor <i>G</i>	
	Cylindrical surface	Spherical surface
20	0.37	0.22
25	0.46	0.31
30	0.58	0.45
35	0.75	0.65
40	1.00	1.00
45	1.40	1.70
50	2.00	2.80

## Cam Followers (Stud Type Track Roller)

This is a track roller complete with stud instead of inner ring, which of the outer ring rolls on the track. These NTN stud type track rollers are applied to eccentric roller, guide roller, rocker arm roller, etc. similarly to the roller followers. One end of the stud is so threaded as to facilitate mounting thereof. And the outer ring is guided in

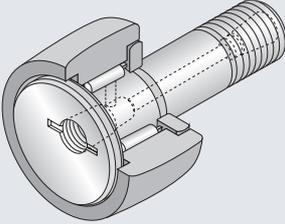

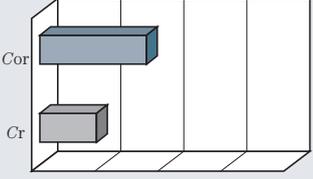

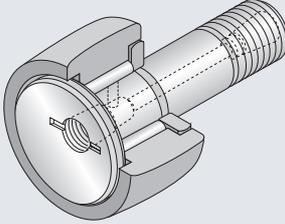

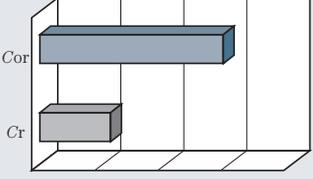

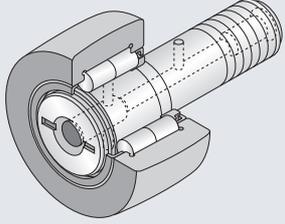

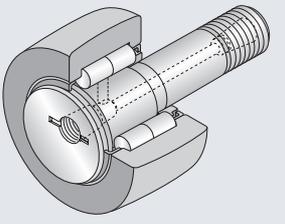

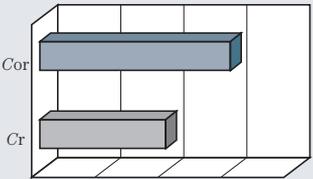

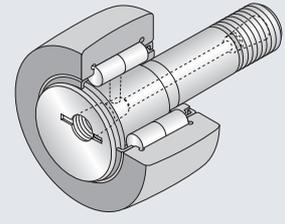

axial direction by the side plates which are press-fitted in the flange end of the stud and the stud itself.

The outer ring has a thick wall and both of spherical outer profile and cylindrical outer surface (tail code: X) are available for it similarly to the outer ring of the roller follower.

## Bearing accuracy

The dimensional accuracy and profile accuracy of cylindrical roller outer diameter ( $D$ ) and outer ring width ( $C$ ), and the running accuracy of bearing assy are as shown in **Tables 4.3** and 4.4 of Section 4 "Bearing Tolerances" (page A-26) and the accuracy class of each conforms to JIS Class-0. The dimensional accuracy of spherical outer diameter ( $D$ ) and stud diameter ( $d_1$ ) are as shown in applicable Dimensions Table.

## Bearing fit and radial internal clearance

**Table 1** shows the recommended fitting tolerance for the stud mounting hole.

And **Table 2** shows the radial internal clearance.

**Table 1 Recommended tolerance**

Classification	Tolerance range class for mounting hole
Metric series	H7
Inch series	F7

**Table 2 Radial internal clearance**

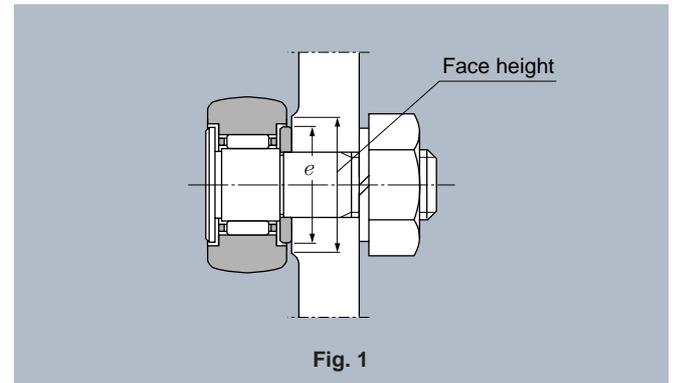

Unit:  $\mu\text{m}$

Nominal roller inscribed circle diameter $F_w$ (mm)		Clearance							
		C2		CN (ordinary)		C3		C4	
over	incl.	min	max	min	max	min	max	min	max
3	6	0	10	3	17	15	30	20	40
6	10	0	12	5	20	15	30	25	45
10	18	0	15	5	25	15	35	30	55
18	30	0	20	10	30	20	40	40	65
30	50	0	25	10	40	25	55	50	80
50	80	0	30	15	50	30	65	60	100
80	100	0	35	20	55	35	75	70	115

**Note)** When shock load acts on, make the stud - hole clearance as less as possible in assembling.

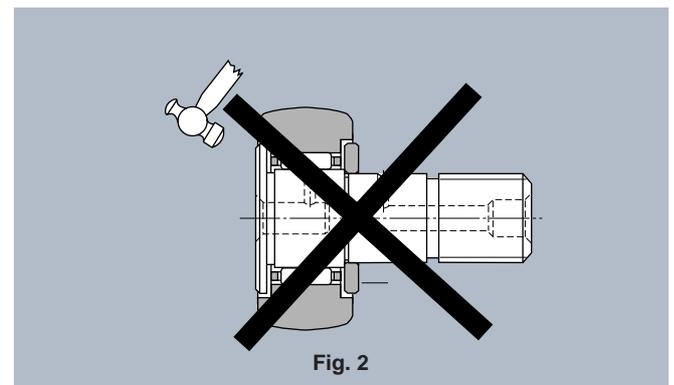

## Fitting relations

- (1) Make the face height at the cam follower mount greater than "e" dimension given in applicable Dimension Table. (**Fig.1**)  
Furthermore, chamfer the stud mounting hole at  $R$  as small as possible (around  $0.5 \times 45^\circ$ ) and bring the side faces of side face in precise contact.

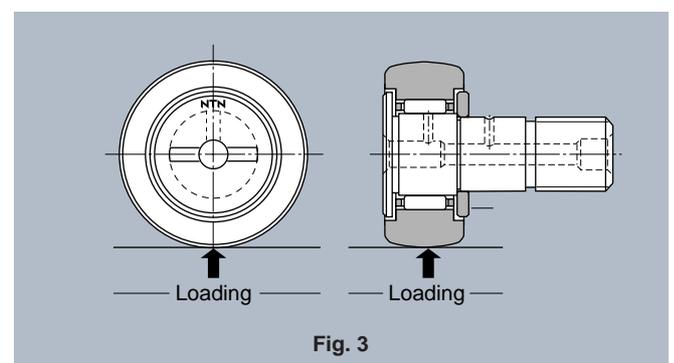

**Fig. 1**

- (2) Don't hammer directly the cam follower rib. Doing so would cause breakdown and rotation failure of the rib.

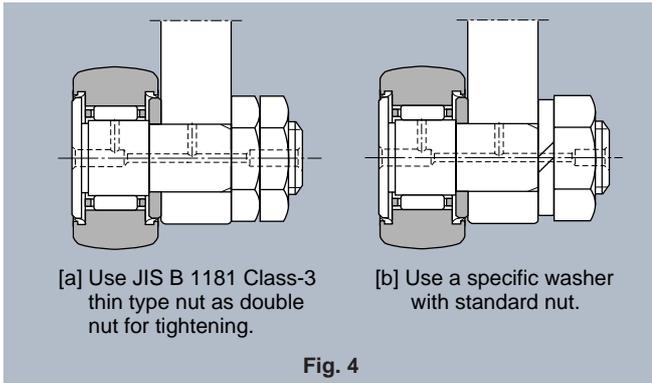

**Fig. 2**

- (3) The oil hole position on the stud raceway surface is shown with NTN mark stamped on the stud rib surface. Mount the stud so the oil hole locates within the non-load area (non-load side). (**Fig. 3**) If the oil hole locates within the load area, it would cause shorter life of the follower.

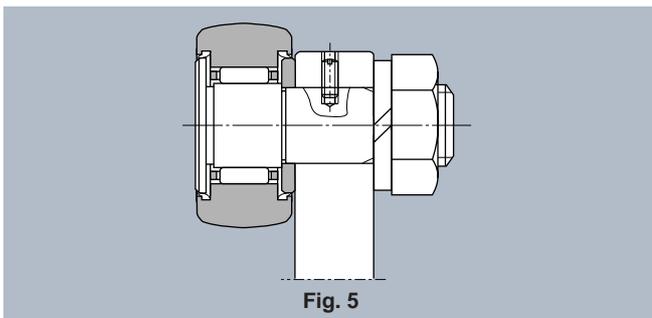

**Fig. 3**

- (4) Particularly where loose of the mounting screw is forecast due to wide amplitude vibration during running, the mounting methods as illustrated in **Fig. 4** are available.

- (5) The stud is subjected to bending stress and tensile force arising from bearing load. Tighten the stud screws with tightening torque which does not exceed the torque value specified in applicable Dimension Table. **Too tight tightening torque could result in rupture of the threaded portion.**
- (6) A hole is provided on the stud center at right angle to the shaft axial center, as illustrated in **Fig. 5**. Use this hole for locking or grease replenishment.

- (7) For mounting and adjusting the eccentric stud type cam follower, follow the sequence given hereunder.
1. Insert the stud in the mounting hole so that the **NTN** mark (showing oil hole position) locates in relative to load acting direction as illustrated in **Fig. 3**.
  2. Turn the stud using the recessed slot for screwdriver on the stud head or the accessory threaded plug with hexagon socket, to adjust a clearance from the mating contact surface.
  3. After adjustment, tighten the stud nut with specific tightening torque described in applicable Dimensions Table.

**NTN cam follower is generally stud-mounted so that non-uniform load (bias load) could act on the bearing, inversely affected by fitting loose arising from continuous running. So, good care must be exercised of fitting loose for stable running of an equipment.**

## Lubrication and how to feed and replenish grease into the follower

### Lubrication

The cam follower type with synthetic rubber seal (with tail code LL) and the full-complement roller type are pre-filled up with lithium soap base grease so they can be used in the operating temperature range of -25 to +100°C.

The type with cage and with no seal is not filled up with grease. If a grease pre-filled type is needed, feel free to contact NTN.

Further, NTN Bearings with Solid Dreeze using solid lubricant of less leakage is also available on request. Feel free to contact NTN for the detailed information.

**The outer ring outer surface of bearing and the track surface must both be lubricated. Failure to lubricate could result earlier in damage of bearing.**

### How to feed and replenish grease

Feed and replenish grease through a grease nipple provided on the flange end face or threaded-side end face of the stud. In this case, plug the grease-feed hole or the tapped hole at non-greasing side (with a special-purposed plug or a threaded plug with hexagon socket.)

These grease nipple and plug are enclosed in each cam follower package. Screw-in them in specific position before mounting the cam follower.

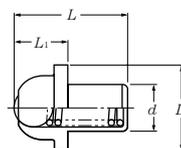

Special grease nipple and that specified in JIS Standard as applicable are available for use. The dimensions thereof and the applicable bearing types are as specified in **Tables 3** and **4** respectively.

Furthermore, special press-fit type plug and threaded plug with hexagon socket are available for use. The dimensions thereof and the applicable bearing types are as specified in **Tables 5-1, -2** and **Table 6** respectively.

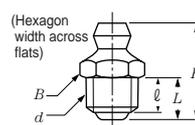

When using the special-purposed press-fit plug, press-fit it in the grease feed hole using a mandrel of applicable dimension shown in **Table 7**.

## Track load capacity

Maximum radial load which is statically allowable on the track roller to track contact surface is referred to as "track load capacity", and the track load capacity subject to track surface hardness HRC40 is as described in applicable Dimensions Table.

Where the track surface hardness is other than HRD40, adjust the track load capacity using the adjustment factor shown in **Table 11.1**.

Note 1) For bearing with cylindrical outer surface, the nominal number is followed by "X" code. In this case, the cylindrical bearing is manufactured with the tolerance for outer ring outer diameter *D* which conforms to JIS Class-0. Ex. KR22XLL

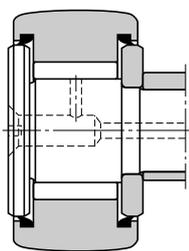

2) Grease replenishing hole is provided at front side only (on left side-face in the above sketch). However, in the case with "hexagon hole" no grease replenishing hole is provided.

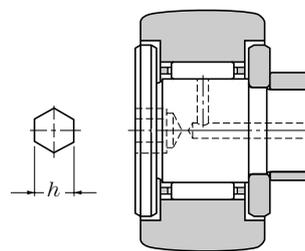

**Type KR·LL**  
(Sealed type with cage)

**Type KRV**  
(Full complement type)

**Type KRV·LL**  
(Full complement type with seal)

**Type KR·H**  
(With hexagonal wrench socket)

Note 3) Cam follower with hexagon hole is standard.

Remarks: For the cam follower with ※marked seal, the allowable running speed is approximately 10 000 r/min.

Note 1) For bearing with cylindrical outer surface, the nominal number is followed by "X" code. In this case, the cylindrical bearing is manufactured with the tolerance for outer ring outer diameter D which conforms to JIS Class-0. Ex. KRU52XLL  
 2) A tapped hole is provided at front side only (on left side-face in the above sketch).

Note 2) Grease replenishing hole is provided at front side only (on left side-face in the above sketch). However, in the case with "hexagon hole" no grease replenishing hole is provided.

Remarks: For the cam follower with ※marked seal, the allowable running speed is approximately 10 000 r/min.

# Thrust Roller Bearings

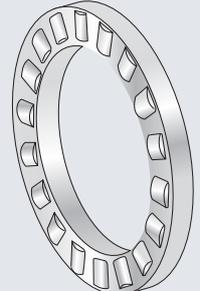

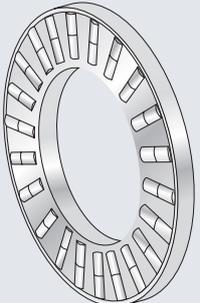

## Thrust Roller Bearings

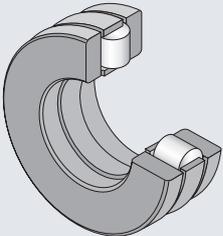

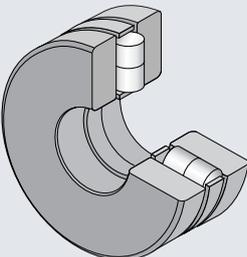

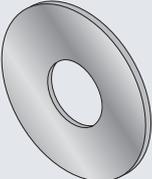

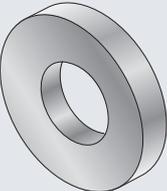

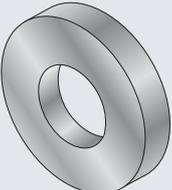

This thrust roller bearing composed of a thrust roller and cage assembly, wherein needle rollers or cylindrical rollers are configured radially in the cage, and a bearing ring of disc form is intended to support one-directional axial load.

In mounting, it is possible to use a shaft or a housing as the direct raceway surface without using the bearing

ring, whereby design of a low height and lightweight compact construction is enabled.

This type of thrust roller bearing results in slipping on raceway surface because theoretically it can't roll perfectly, but in most cases it is practically trouble-free and can rotate at comparatively high speed.

Bearing type	Cage type	Applied shaft dia (mm)	Composition of nominal number	Nominal number	Remarks
<b>AXK</b> 	Punched steel plate cage	$\phi 10 \sim \phi 120$	<b>AXK 11 04</b> — Bore diameter code — Dimension series code — Type code	<b>AXK1104</b>	Possible to use in combination with AS type bearing ring.

### Bearing accuracy

The respective dimensional accuracy, profile accuracy and running accuracy of thrust cylindrical roller bearings 811, 812 and 893 are as shown in **Table 4.4** of Section 4 "Bearing Accuracy" (page A-28).

The thrust roller and cage assemblies (**AXK, K811, K812, K893**) are machined with dimensional tolerance E11 for the bore diameter ( $D_{e1}$ ) (E12 for bearing number with T2 code) and with dimensional tolerance c12 for the outer diameter ( $D_e$ ) of **Type AXK** and a13 for the diameter ( $D_e$ ) of **K811, K812 and K893**.

### Raceway surface requirements:

Where the plane portion of a shaft/a housing is used as the direct raceway surface of thrust roller and cage assembly, the raceway surface must meet the requirements specified as a guideline in **Table 1**.

**Table 1 Raceway surface requirements**

Characteristics	Specified requirements
Perpendicularity (Max)	IT6 (IT4)
Surface roughness	0.2a
Surface hardness	HRC58~64
Effective hardened layer depth	Refer to Formula (7.1) on page A-39.

Reference : The parenthesized value shall be applied for high running accuracy.

### Cage guiding

The thrust roller and cage assemblies (**AXK, K811, K812 and K893**) must be guided at either the bore side (shaft side) or the outer surface side (housing side) for in-running centering.

In general, the bore-side guide of low relative speed against the cage is mostly used. It should be used particularly for high speed running. The dimensional tolerances for shaft and housing, when the cage is guided thereby, shall be h8 for shaft diameter (bore guide) and H9 for housing bore diameter (outer surface guide) respectively, which of the guide surface shall be fine-finished by grinding.

### Bearing fit in bearing ring

**Table 2** shows the tolerances for fitting of the thrust bearing rings (**AS, WS and GS**) on shaft or in housing.

**Table 2 Bearing ring fit in shaft and housing**

Bearing ring	Shaft	Housing
Series AS	h10	H11
Series WS	h6	—
Series GS	—	H7

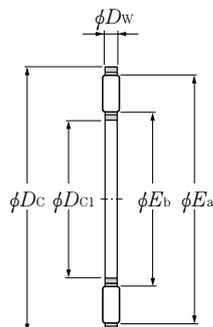

### Mounting related dimensions

The dimensions related to fitting of **WS** and **GS** bearing rings on shaft and in housing are as described in applicable Dimensions Table.

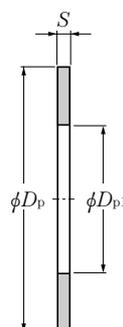

The fitting surface of **AS** bearing ring must be flat and have the rigidity sufficient to support thrust load throughout its entire surface.

## Needle Rollers/Snap Rings/Seals

## Needle Rollers

NTN needle rollers are all made of high carbon chrome bearing steel, fine-finished by grinding and polishing after heat-treated, and the hardness thereof ranges from HRC60 to 65. These needle rollers are supplied as not only rolling element but also pin and shaft individuals.

### End face profile of needle roller

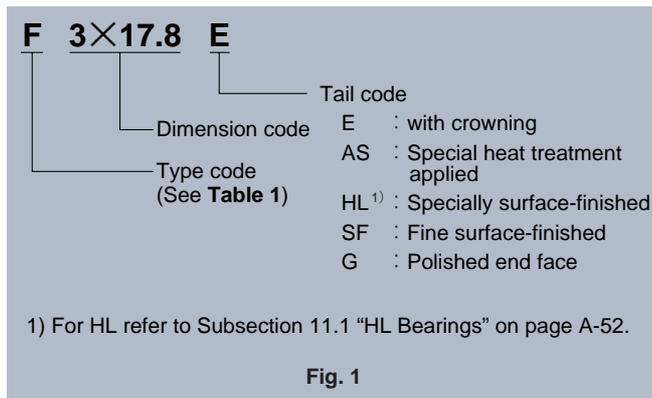

F-type needle roller bearing with flat end face is standard type, while A-type with round end face is semi-standard type. In addition to these two types, another needle roller type (nominal number with tail code E) capable of damping edge load is also available. Feel free to contact NTN for the detail thereof.

**Table 1 End face profile**

Type	Name	Profile
F	Flat	
A	Round	

### Composition of nominal code

The nominal number comprises type code (end face profile), dimension code [diameter ( $D_w$ ) $\times$ length ( $L_w$ )] and tail code.

### Needle roller tolerances

Any needle rollers are manufactured with dimensional accuracy and profile accuracy conforming to JIS B 1506 (Rollers for Roller Bearings). (**Table 2**)

**Table 2 Needle roller tolerances**

Unit:  $\mu\text{m}$

Characteristics	Tolerance and allowable value
Tolerance for mean value of diameter $D_w$	0 $\sim$ -10
Mutual deviation of diameter $D_w$	2
Roundness of diameter $D_w$ , variation in diameter	1.0 ( $L_w/D_w \leq 6$ ) 1.5 ( $L_w/D_w > 6$ )
Tolerance for length $L_w$	h13
Accuracy class	Class-2

The needle rollers are delivered contained in same package after the mutual deviation of diameter  $D_w$  was assorted to  $2\mu\text{m}$  and less. Before being delivered, the needle rollers are identified by label colors such as red, dark blue, blue, etc. according to the respective dimensional tolerances.

**Further, mixed use of needle rollers contained in packages of different label colors is prohibited.**

**Table 3 Discrimination of needle rollers**

Label color	Dimensional tolerance range $\mu\text{m}$	Discrimination
Red	0 $\sim$ - 2	Standard
Dark blue	-1 $\sim$ - 3	
Blue	-2 $\sim$ - 4	
Black	-3 $\sim$ - 5	
White	-4 $\sim$ - 6	
Gray	-5 $\sim$ - 7	Semi-standard
Green	-6 $\sim$ - 8	
Brown	-7 $\sim$ - 9	
Yellow	-8 $\sim$ -10	

**Application of needle rollers**

When composing a full-complement roller type needle roller bearing using standard needle rollers, shaft diameter ( $d$ ), housing hole diameter ( $D$ ), circumferential clearance ( $\Delta C$ )

and radial clearance ( $\Delta r$ ) must be determined respectively. These can be calculated as follows from needle roller diameter ( $D_w$ ) and number of rollers ( $Z$ ). (Refer to **Fig. 2**)

Determine the minimum value of circumferential clearance ( $\Delta C$ ) using **formula (1)**. And select radial clearance ( $\Delta r$ ) according to applicable shaft diameter and operating conditions, in reference to **Table 5.1**, as the guideline, of 5.1 “**Bearing Radial Clearance**” (page A-30). In general, full-complement roller type bearing needs radial clearance larger than that in needle roller and cage assembly type roller bearing.

$$\Delta C = (0.005 \sim 0.020) \times Z \text{ mm (minimum value)} \quad (1)$$

Then, determine the minimum value of housing bore diameter ( $D$ ) and the maximum value of shaft diameter ( $d$ ) using the **formulas (2) and (3)**.

$$D = \left[ \frac{1}{\sin\left(\frac{\pi}{Z}\right)} + 1 \right] \cdot D_w + \frac{\Delta C}{\pi} \text{ mm (minimum value)} \quad \dots\dots\dots(2)$$

$$d = D - 2D_w - \Delta r \text{ mm (maximum value)} \quad \dots\dots\dots(3)$$

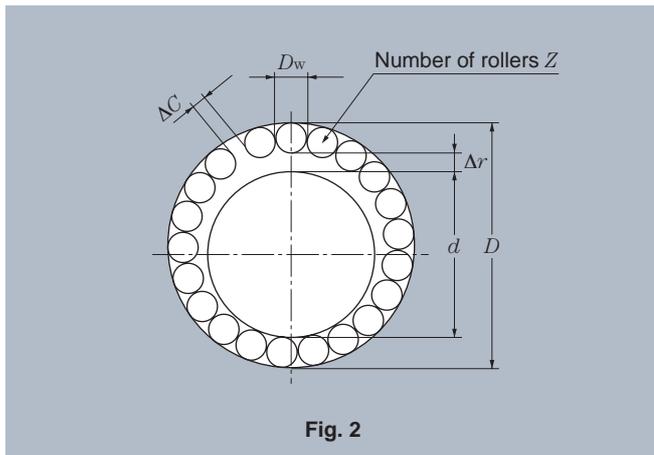

Fig. 2

The maximum value of housing bore diameter ( $D$ ) required to retain needle rollers in a housing by a keystone can be determined from the minimum diameter value ( $D_{w \text{ min}}$ ) of the roller and the number of rollers using **formula (4)**. The coefficient  $K$  to be used in that time is as shown in **Table 4**.

$$D = K \cdot D_{w \text{ min}} \text{ mm (max.)} \quad \dots\dots\dots(4)$$

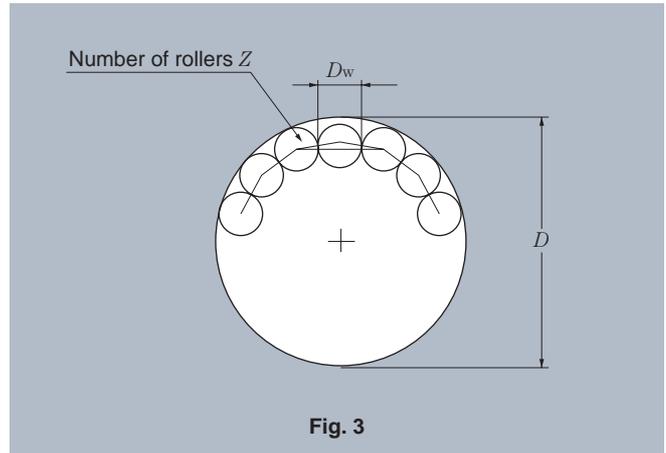

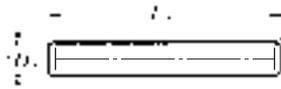

Fig. 3

## Snap Rings

These snap rings are used exclusively for fixing or guiding a needle roller bearing ring or cage in axial direction. Furthermore, these snap rings have the profile identical to C-type concentric snap ring specified in JIS B 2806 and, in addition, snap rings with smaller section height (*b*) and also available in smaller dimension range are manufactured according to application of needle roller bearings. These snap rings are manufactured using hard steel wire rod and, after manufactured, chemical conversion treatment is applied to the surface thereof.

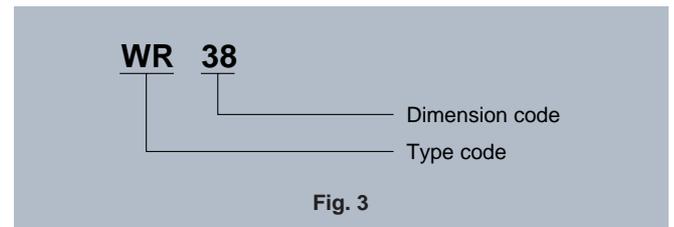

### Types of snap ring

Two types of snap ring are available; one is **Type WR** designed for application to shaft and another is **Type BR** for application to bearing housing.

### Composition of nominal number

The snap ring nominal number is composed of type code (**WR** or **BR**) and dimension code. The dimension code represents applicable shaft diameter in **Type WR** and applicable housing bore diameter in **Type BR**.

### Allowable running speed

The allowable running speed for **Type WR** for shaft application is as described in applicable Dimensions Table. This means the running speed when snap ring begins to get loose with opening of its cut ends.

### Mounting relation

It is recommended to insert a spacer between snap ring and cage for guiding the cage in axial direction. On occasion, snap ring is difficult to remove, but limited to a portion in which a pull-out

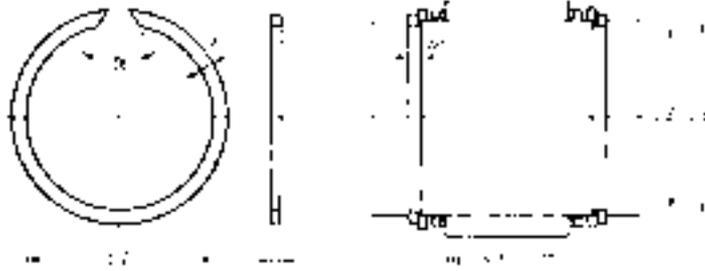

tool can not be inserted easily. In such a case, it is necessary to consider the use of general snap rings specified in JIS B 2804 (C-type snap rings) or B 2806 (C-type concentric snap rings).

Table 1 Cut section angle of snap ring ( $\alpha$ )

Type	Nominal number	Cut section angle( $\alpha$ )
Type WR	WR4, WR5	40°
	Type WR6 up to	60°
Type BR	All nominal numbers	90°

## Seals

### Seals

These are the special-purposed seals for needle roller bearings whose cross sectional height is designed so small as to match applicable needle roller bearings. These contact seals are made of synthetic rubber reinforced with steel plate, being then used in operating temperature range of -25 to +120°C and, under continuous running, at 100°C and less. Further, feel free to contact **NTN** for the use of these seals under special operating condition, e.g. operating temperature of over 120°C.

### Types of seal

Two different seal types are available; one is **Type G** with one lip and another is **Type GD** with two lips. In addition to these two, sliding rubber seals (**LEG**, **LEGD**), wherein lubrication property was assigned to a rubber material fulfilling low torque under an non-lubrication environment, are also manufactured. Feel free to contact **NTN** for the detail of these seal types.

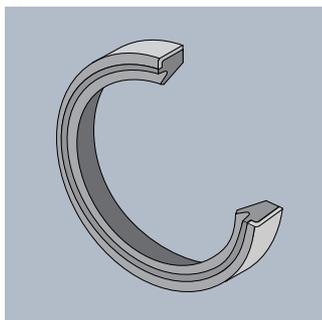

Fig. 1 Type G (LEG)

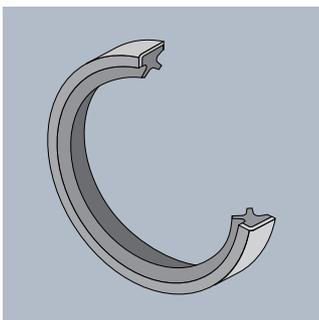

Fig. 2 Type GD (LEGD)

Where seal contact surface and lubricating condition are good, **Type G** with one lip can be used up to 10m/s maximum at peripheral speed and **Type GD** with two lips used up to 6m/s maximum.

**This seal is intended to hold grease and to prevent dust invasion from outside. It has no function to hold lubrication oil, etc. unlike oil seal.**

### Composition of nominal number

Nominal seal number is composed of type code (G, GD) and dimension code (bore dia. × outer dia. × width).

Fig. 3

### Fitting relations

The seal contact surface must be finished by grinding, after hardened, to get its good sealing performance. In addition, harmful flaw and indent are not allowed to exist on the seal contact surface. Where the inner ring raceway surface is used as seal contact surface, a wide inner ring must be used.

When fitting a seal in a bearing, it is desirable to taper the shaft end face or the housing end face so as to protect the seal lip and outer surface from damaging, as illustrated in **Fig. 4**. Where shaft end is not tapered or chamfered (rounded), it is recommended to a fitting jig as illustrated in **Fig.5**. Regarding the seal to housing interference, a adequate interference can be got in the usual housing tolerance range of G7 toR7.

**Furthermore, it is recommended to apply pre-coat of a lubricant to the seal lip before fitting seals G and GD, for better lubrication. Further, when fitting a seal and inserting it through a shaft, take good care to protect its lip from deforming.**

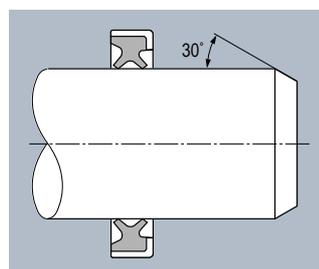

Fig. 4

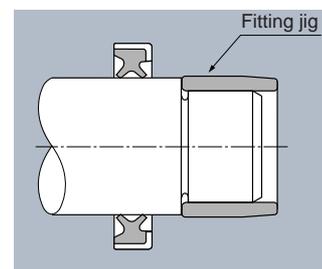

Fig. 5

### Seal application examples

**Figs.6 to 8** illustrate design examples using these seals.

## **LINEAR BALL BEARINGS: Solid, Drawn Cup, Stroke, Linear Flat Roller, and Linear Roller Bearing Types**

## Linear Ball Bearings

Type	Applied shaft diameter (mm)	Composition of nominal number
<p><b>KLM</b></p>  <p>This type composed of an outer ring, steel balls and a cage is a cylindrical bearing for the most universal applications, which ensures precise and smooth infinite linear motion due to its outer ring of high rigidity.</p>	<p><math>\phi 3 \sim \phi 40</math></p>	<p><b>KLM 06 L</b></p> <ul style="list-style-type: none"> <li>— Tail code</li> <li>— Inscribed circle diameter</li> <li>— Type code</li> </ul>
<p><b>KLM · S</b></p>  <p>This type is composed of an outer ring, steel balls and a cage. And both of the outer ring and the cage have an axial slit, as illustrated, so as to enable to shrink the inscribed circle diameter of the cage by pressing the outer ring in radial direction from the housing and to thereby adjust radial clearance from shaft. Thus, this type also ensures precise and smooth infinite linear motion.</p>	<p><math>\phi 16 \sim \phi 40</math></p>	<p><b>KLM 30 S</b></p> <ul style="list-style-type: none"> <li>— Tail code</li> <li>— Inscribed circle diameter</li> <li>— Type code</li> </ul>
<p><b>KLM · P</b></p>  <p>This type is composed of an outer ring, steel balls and a cage. And the outer ring and the cage are of arc sectional shape, from which one row of balls (equivalent to 50° to 60° degree spacing) is removed. Thus, the arc cross-sectional ring and cage with 50° to 60° degree opening allows the bearing assy to pass through a shaft support truss or a shaft support stand on midway of the shaft stroke. This type also ensures precise and smooth infinite linear motion, similarly to other types. The bearing radial clearance can be also adjusted.</p>	<p><math>\phi 16 \sim \phi 40</math></p>	<p><b>KLM 30 P LL</b></p> <ul style="list-style-type: none"> <li>— Tail code</li> <li>— Tail code</li> <li>— Inscribed circle diameter</li> <li>— Type code</li> </ul>
<p><b>KH</b></p>  <p>This type is composed of an outer ring, steel balls and a cage and the outer ring is cylindrical similarly to that of Type KLM and drawn from a steel plate by precision deep drawing, then enabling to design a compact bearing construction of low section and lightweight. This type also ensures precise and smooth infinite linear motion similarly to other types.</p>	<p><math>\phi 6 \sim \phi 50</math></p> <p>With seal <math>\phi 10 \sim \phi 50</math></p>	<p><b>KH 20 30 LL</b></p> <ul style="list-style-type: none"> <li>— Tail code</li> <li>— Width</li> <li>— Inscribed circle diameter</li> <li>— Type code</li> </ul>

Components	Infinite motion	Finite motion	Rotating motion	Remarks
Inscribed circle diameter: $\phi 6$ L: Single-side seal	○	—	×	<p>The cages of the bearing types KLM, KLM, S, KLM,P and KH are all molded from polyamide resin and, therefore, these bearing types shall be used at allowable temperature 120°C and, under continuous running, at 100°C and less.</p> <p>Furthermore, the operating temperature shall be held within the range of -25 to 100°C to prevent deterioration of seal and grease.</p> <p>These bearing types can't rotate.</p>

Components	Infinite motion	Finite motion	Rotating motion	Remarks
Inscribed circle diameter: $\phi 20$ Outer diameter: $\phi 32$ Width: 45	—	○	○	The operating temperature shall be held within the range of -25 to 100°C, to prevent deterioration of seal and grease.
Roller diameter: f2.5 Width: 18 ZW: Double-row type	○	—	×	Due to its resin cage, this bearing shall be used at allowable temperature 90°C and, under continuous running, at 80°C and less. The double-row type has an elastic joint on the cage center so double rows of flat rollers can be bent to any optional angle along the elastic joint by heating them in oil of 70 to 90°C. By cooling down the double-row rollers with the bent angle held unchanged for several seconds after having bent them to any optional angle, the bent shape of the double rows can be held unchanged so that the double-row rollers can be mounted on a V-shaped surface as illustrated.
Roller diameter: f3 Width: 20 Cage length: 1000	○	—	×	Where the resin cage RF is used, the bearing shall be used at allowable temperature 90°C and, under continuous running, at 80°C and less.  The standard length of the bearing unit with BF cage is 1000 mm. The standard length of the bearing unit with RF cage is 705 mm. Two or more bearings of this type can't be jointed with each other, but it can be supplied at any desired length on request.
Section height: 26 Bearing overall length: 86	○	—	×	

## Linear Ball Bearings, Solid and Drawn Cup Types

Four to nine rows of balls are configured equally in the outer ring (outer cylinder). The ball rows circulate in axial direction while being guided by the cage. Thus, these bearing types move infinitely on a shaft in axial direction. However, these bearing types can't rotate.

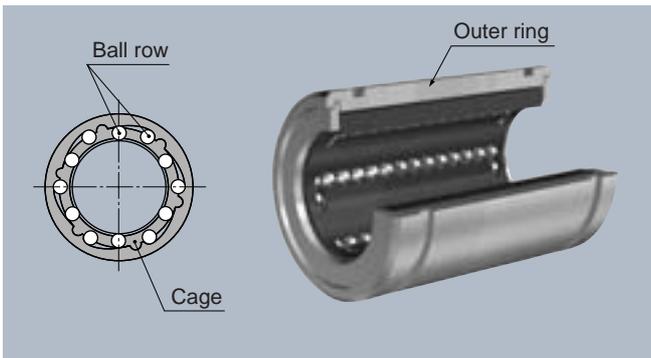

Fig. 1

### Dimensional accuracy

The respective accuracy of the boundary dimensions, inscribed circle diameter ( $F_w$ ), outer diameter ( $D$ ), and width ( $C$ ) of **Type KLM** (solid type bearing) are as described in applicable Dimensions Table. Same bearing with higher dimensional accuracy is offerable on special request. Feel free to contact **NTN** when such a bearing is needed.

**For Type KH** (drawn cup type), its outer ring is so thin-walled that it deforms inevitably to some extent in the manufacturing processes, particularly heat-treating process, but it is so designed as to be restored normally from such deformation and fulfill its specific function with the required accuracy by being press-fitted in a housing with the required dimensional accuracy.

Feel free to contact **NTN** for the method of measuring the dimensional accuracy.

### Bearing fit

The use of a shaft or a housing with the dimensional tolerance shown in **Table 1** would ensure proper radial clearance. Where further small radial clearance is wanted or preload is applied, the radial clearance is adjusted using a split housing or otherwise bearing fit required for smaller clearance or preload is selected.

Table 1 Bearing fit

Type	Shaft	Housing
series KLM Solid type	g6 (g5)	H7 (H6)
series HK Drawn-cup type	h6 (j5)	H7 (H6) - steel series - K7 (K6) - light metal alloy series -

Note) The parenthesized data is applied to shaft/housing subjected to higher accuracy or of vertical construction.

### Shaft and housing requirements

Any shaft /housing on/in which these bearing types are fitted must meet the requirements specified in **Table 2**.

Table 2 Shaft and housing requirements

Characteristics	Shaft	Housing
Roundness (max)	IT3	IT4
Cylindricity (max)	IT2	IT4
Surface roughness (max.)	0.4a	1.6a
Surface hardness	HRC58~64	—
Hardened layer depth (min)	0.4mm	—

### How to mount

The housing for **Type KLM** (solid type) can't be fixed perfectly with interference only and, therefore, must be fixed in axial direction using a snap ring.

On the other hand, **Type KH** (drawn cup type) needs no axial fixing by a snap ring because it is press-fitted in a housing with interference. For press-fitting, press the outer ring at its stamped mark side (hardened side) using a mandrel illustrated in **Fig.2**.

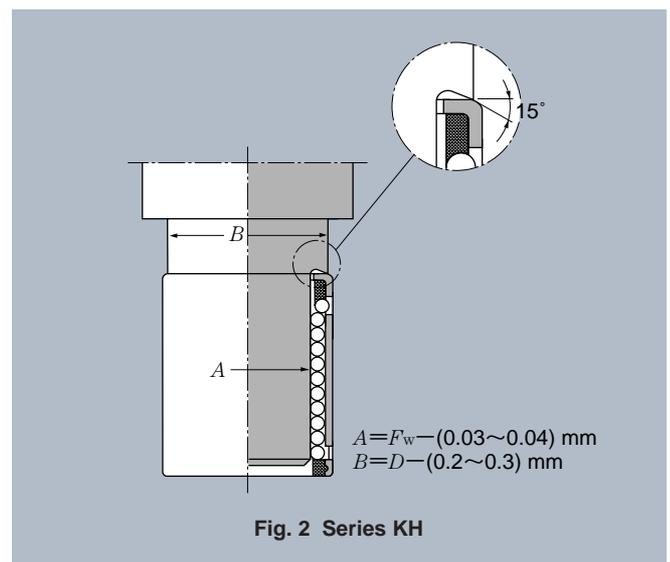

Fig. 2 Series KH

### Accessories

Shafts, shaft support stands and housings exclusive for **NTN** linear ball bearings are also offerable. Feel free to contact **NTN** for the detailed information.

## Linear Ball Bearings, Stroke Type

The bearing cage with multiple ball rows (several balls per row) configured circumferentially therein can move within the outer ring in both circumferential and axial directions. Thus, this bearing type can rotate and reciprocate (but at a limited stroke) on a shaft.

### Bearing construction

Maximum available length of the reciprocal stroke is two times as long as the stroke at which the cage can reciprocate within the outer ring. The outer ring is provided at its both ends with a snap ring acting as a stopper and a wave spring is provided between the snap ring and the cage to damp a shock acting on the cage as well as to prevent wear of the cage.

In addition to the standard type, a special type with synthetic rubber seal (Tail code: LL) on the both ends of its outer ring is also available.

### Dimensional accuracy of Bearing

Table 1 the bearing tolerance.

Table 1 Dimensional accuracy

Characteristics	Dimensional tolerance
Ball inscribed circle diameter ( $F_w$ )	F6
Outer ring outer diameter ( $D$ )	h5

### Bearing fit and radial clearance

Any linear ball bearings must be used with radial clearance as less as possible. Particularly where linear ball bearing is applied to a vertical shaft or high accuracy is required, it is desirable to select and combine appropriate bearing and shaft for securing radial clearance in the range of 0 to  $-10 \mu\text{m}$  (by preloading).

Table 2 shows the bearing fits on shaft and in housing.

Table 2 Bearing fits

Operating conditions	Shaft	Housing
Usual operating conditions	k5 (m5)	H6 (H7)
Vertical shaft and high accuracy applications	n5 (p5) <sup>①</sup>	J6 (J7)

① Selective fit

### Shaft and housing requirements

Table 3 specifies the requirements for shaft and housing which of the outer surfaces are used as the direct raceway.

Table 3 Shaft and housing requirements

Characteristics	Shaft	Housing
Roundness (max)	IT2	IT4
Cylindricity (max)	IT2	IT4
Surface roughness (max)	0.2a	1.6a
Surface hardness	HRC58~64	—
Hardened layer depth (min)	0.4mm	—

### How to mount

This bearing type can't be fixed perfectly to a housing with interference only and, therefore, it is fixed in axial direction using a snap ring. (Refer to Fig. 1)

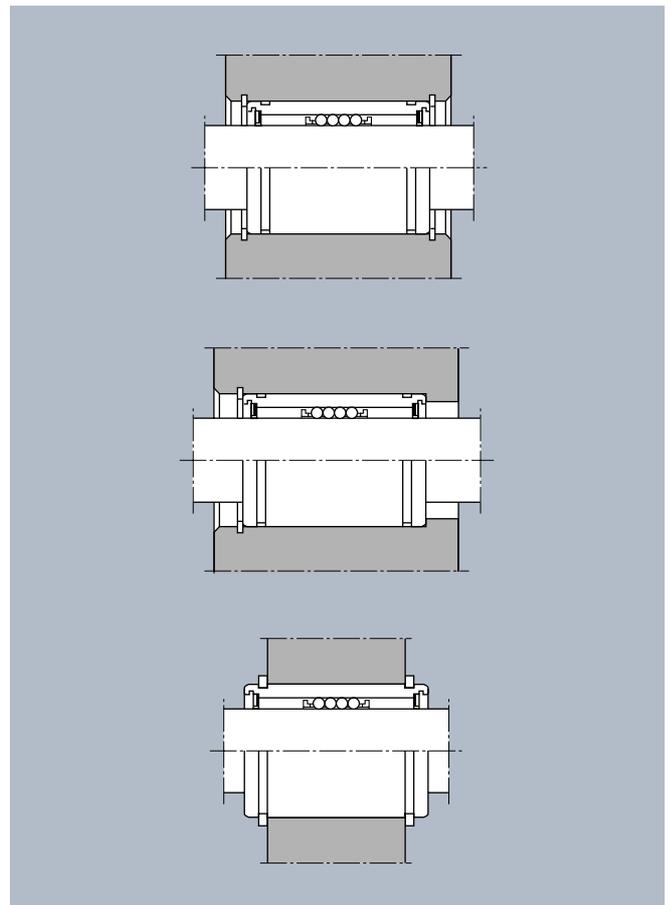

Fig. 1 Axial fixing of bearing

For adjusting the cage so it locates at the outer ring center after a shaft was mounted, push the cage in the arrow direction in **Fig. 2** by inserting the shaft into the outer ring that was press-fitted in the housing. (**Fig. 2**)

In this condition, insert slowly the shaft up to the center point of the reciprocating stroke and, thereafter, further push-in the shaft by 1/2 of the stroke. (**Fig. 3**) Then, return the shaft by 1/2 of the stroke to thereby locate the cage at the outer ring center and the shaft at the center point of the reciprocating stroke. (**Fig. 4**)

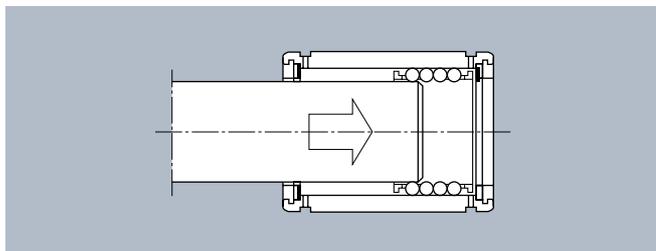

Fig. 2

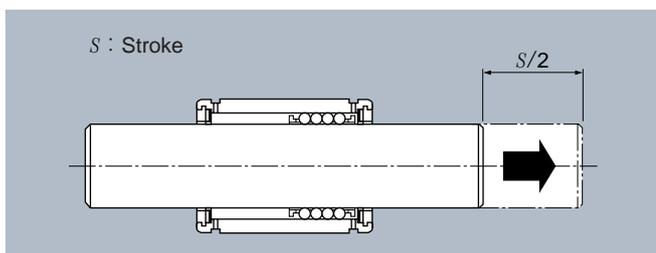

Fig. 3

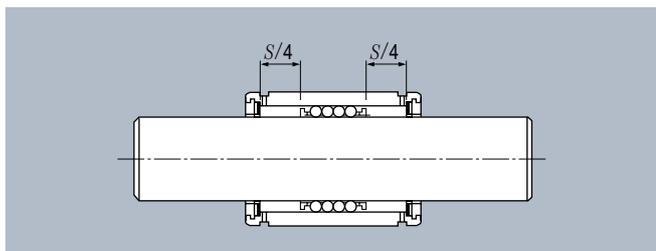

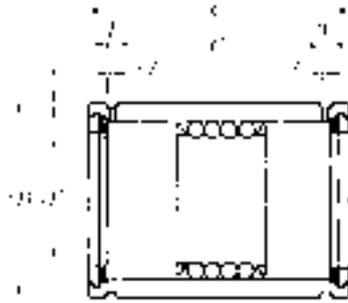

Fig. 4

**The outer ring must be press-fitted so its grease feed hole locates at load non-acting side.**

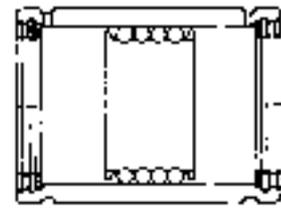

**Where moment load acts on a bearing due to use of a vertical shaft, the load could act on the grease feed hole. Caution it.**

## Linear Flat Rollers

### Linear Flat Rollers

This bearing type composed of a needle roller and flat cage assembly (needle rollers are configured in the flat cage) ensures smooth reciprocating motion with less friction coefficient.

### Types

For **Type FF**, the polyamide resin cage has a dovetail joint groove on its both ends so that several cages can be jointed together into one unit.

For **Type FF·ZW**, two rows of needle rollers are configured in the cage and the cage has an elastic joint on its center so as to enable to bend two rows of flat rollers to any optional angle at the elastic joint by heating them in oil of 70 to 90°C. The two roller rows bent to any optional angle can hold the bent shape unchanged, even under normal operating temperature, by being cooled down for several seconds, with the bending angle held unchanged.

For **Type BF**, the cage is press-formed from steel plate and the standard length of the bearing unit is 1000 mm.

For **Type RF**, the cage is of polyamide resin and the standard length of the bearing unit is 705 mm. The both are unavailable for cage to cage inter-jointing, but a bearing unit of any desired length is offerable upon request. Feel free to contact **NTN** for the detailed information.

### Needle roller tolerance

The needle rollers contained in the flat roller cage are manufactured within the dimensional tolerance range of 0 to -2 mm against the nominal diameter ( $D_w$ ).

### Raceway surface requirements

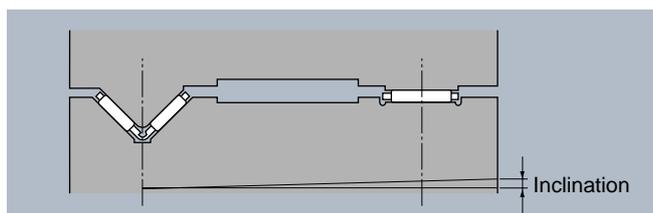

**Table 1** shows the requirements for raceway surface applied to the linear flat roller bearings.

**Table 1 Raceway surface requirements**

Characteristics	Tolerance
Surface roughness (max)	0.2a
Surface hardness ❶	HRC58~64
Effective hardened layer depth (min)	0.4mm
Mounting accuracy (max) ❷	0.1 mm per 1000 mm

❶ Where raceway surface hardening not allowed, a quenched spring plate may be used.

❷ Mounting accuracy is expressed with an inclination value in **Fig. 1**.

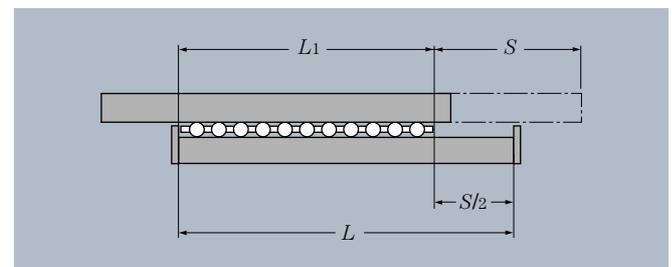

**Fig. 1**

### How to mount

Theoretically the linear flat roller bearing moves by 1/2 of table moving stroke in same direction as the table moving direction. The relationship of bed length ( $L$ ) - stroke ( $S$ ) - cage length ( $L_1$ ) can be expressed in **formula (1)**. (**Fig. 2**)

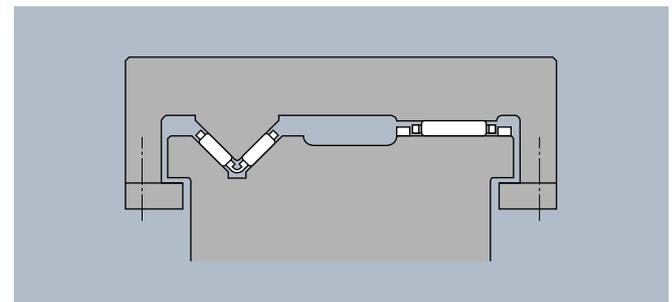

$$L = S/2 + L_1 \dots\dots\dots(1)$$

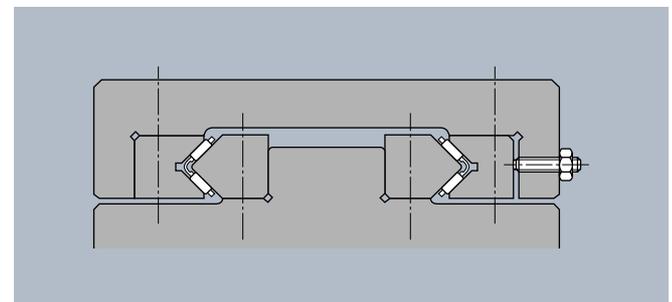

**Fig. 2**

The linear flat roller bearing results in moving deviation due to profile deviation of raceway surface, uneven load or vibration. Therefore, the table or the bed must be equipped with a stopper at its end portion to prevent over-run of the flat roller bearing. (**Fig. 5**)

**Figs. 3 and 4** illustrate application examples of the linear flat roller bearing unit.

**Fig. 3 General application**

**Fig. 4 When overhung load acts on**

7	35	1 000	30	11	10.5	185 000	445 000	18 900	45 500	BF7035/1000	35.5 $\begin{smallmatrix} +0.1 \\ 0 \end{smallmatrix}$	6.7 $\begin{smallmatrix} 0 \\ -0.2 \end{smallmatrix}$	0.110

Note 1) The dimensional tolerance for needle roller diameter  $D_w$  is 0 to  $-2 \mu\text{m}$ .

2) The standard length  $L_1$  of the cage shall be 1000 mm for Type BF and 705 mm for Type RF.

Where special cage length is required, the nominal bearing number is followed by the numerical length value as exemplified below.

Ex. Where  $L_1 = 500$  mm is required for **BF3020**, **BF302/500**

3) The listed basic load ratings are subject to use of 10 flat rollers. Calculate the basic load ratings for any optional cage length  $L_1$  by the following formula.

$$C = f_1^{7/9} \cdot C_r$$

$$C_0 = f_1 \cdot C_{0r}$$

$$\text{Herein, } f_1 = 0.1 (L_1 + l - 2a) / l$$

4) The listed weights are subject to  $L_1 = 100$  mm.

Remarks: For **Type BF**

- On occasion, the length of an ordered unit could be shorter by  $l$  dimension shown in each Dimensions Table because the roller and cage assy is cut at the minimum unit of each pocket so as to match the required length.
- Where this bearing unit is used frequently at various lengths, it is more economical to cut the standard bearing of 1000 mm length to each desired length at your side.

## Linear Roller Bearings

This roller bearing with cylindrical rollers having the function capable of circulating within the raceway block ensures smooth infinite linear motion on a flat surface. The cylindrical rollers are retained and guided by the cage and the ribs of the raceway block.

The cage is of such a construction as not allow adjacent rollers to contact with one another. Hence, the friction coefficient is low.

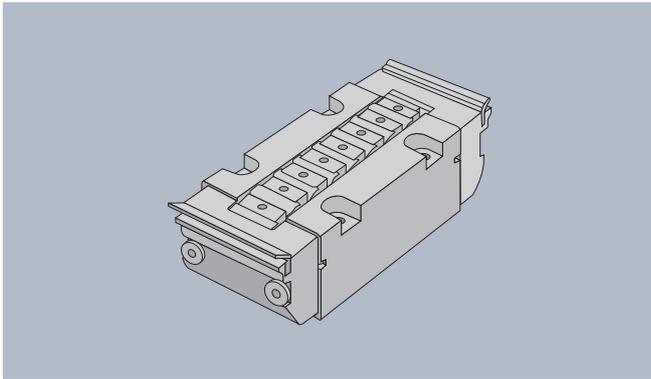

Fig. 1

### Bearing accuracy

All the linear roller bearings are manufactured within the dimensional tolerance range of 0 to  $-2.5\mu\text{m}$  for bearing height ( $H$ ). And these bearings are delivered classified into 5-stepped tolerance classes. (See Table 1)

Table 1 Classification of bearing height  $H$  by accuracy class

Unit:  $\mu\text{m}$

Class code	Tolerance for height ( $H$ )
1H	0 ~ - 5
2H	- 5 ~ -10
3H	-10 ~ -15
4H	-15 ~ -20
5H	-20 ~ -25

### Requirements and tolerances for raceway surface and mounting surface

Table 2 shows the requirements and tolerances for the raceway surface, on which linear roller bearing rolls, and the bearing mounting surface. Where adhesion of a hard foreign matter to the raceway surface is forecast, the raceway surface must be protected with a proper protective cover.

The reference surface for mounting is the back face and opposite face to NTN mark.

Table 2 Requirements for raceway surface and mounting surface

Characteristics	Allowable value or tolerance range
Raceway surface roughness (max)	0.2a
Raceway surface hardness	HRC58~64
Effective hardened layer depth of raceway surface (min)	as described in applicable Dimensions Table
Parallelism of mounting surface	
$\Delta x$ (See Fig. 2)	0.05 mm per 100 mm
$\Delta y$ (See Fig. 3)	0.01 mm per 100 mm

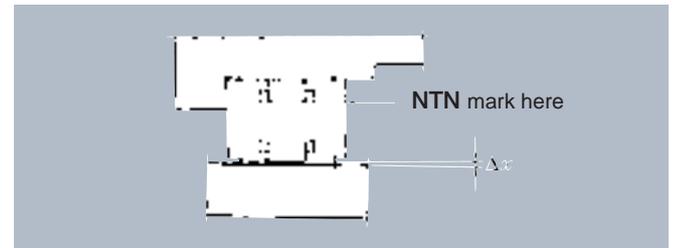

Fig. 2

Fig. 3

# One-way Clutches Tension Pulleys, Bottom Roller Bearings

## One-way Clutches

This is a compact and roller type one-way clutch which formed a cam face on its outer ring. (Available shaft diameter range: 6 to 35 mm) When the outer ring is going to rotate counterclockwise against shaft rotation (arrow → direction on outer ring widthway surface), the rollers advance to the position of engagement with the outer ring cam face by spring action and drive the shaft by acting as a wedge between the outer ring cam face and the shaft. (See Fig. 1) When the outer ring rotates clockwise against the shaft, the shaft rotates counterclockwise relative to the outer ring and, as the result, the rollers get away from the outer ring cam face and simultaneously the outer ring idles against the shaft. (See Fig. 2)

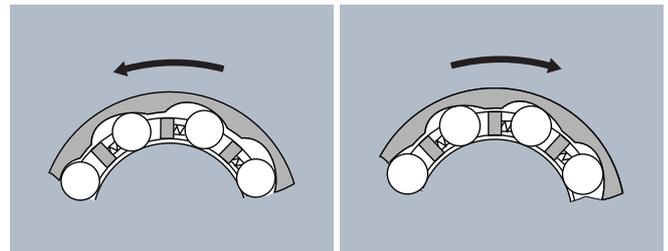

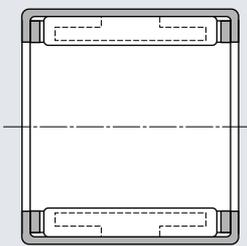

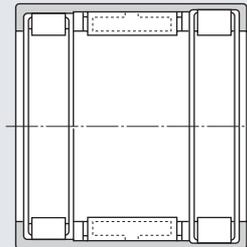

Fig. 1  
One-way clutch in engagement

Fig. 2  
One-way clutch in idling

Type	Applied shaft diameter (mm)	Composition of nominal clutch number	Remarks
<p><b>Type HF</b></p> 	$\phi 6 \sim \phi 35$	<p><b>HF 10 12</b></p> <p>Width Bore diameter Type code</p>	<p>One-way clutch HF composed of an outer ring drawn from a thin steel plate by precision drawing has the clutching function only.</p> <p><b>This one-way clutch must be provided with a bearing at its both sides to support radial load acting thereon and to ensure smooth rotating motion.</b></p>
<p><b>Type HFL</b></p> 	$\phi 8 \sim \phi 35$	<p><b>HFL 10 22</b></p> <p>Width Bore diameter Type code</p>	<p>One-way clutch HFL has an outer ring drawn from thin steel plate by precision drawing, a clutching function, and an integral needle roller and cage assembly capable of supporting radial load at its both ends respectively. Thus, this HFL can function as clutch and, in addition, support radial load.</p>

Both of Type HF and HFL use a polyamide resin cage and press the needle rollers to a wedge, which is formed between the outer ring cam face and the shaft, by action of a plate spring supported with the cage.

### Clutch fit

Table 1 shows the one-way clutch fits on shaft and in housing. Both of Type HF and HFL are only press-fitted in a housing, needing no axial fixing by use of a snap ring, etc.

However, due to the outer ring drawn from thin steel by precision drawing, the performance of the both is directly affected by the dimensional and profile deviations of the shaft/housing. To avoid such an inverse affect, shaft and housing accuracy must be controlled with good care. Any housing is required to have the wall thickness of a

specified value or more. Table 2 shows the recommended value.

Table 1 Clutch fits

Type	Shaft	Housing	
		Iron series	Light metal alloy
HF	h5 (h6)	N6 (N7)	R6 (R7)
HFL			

Table 2 Recommended housing wall thickness

Housing material	Housing wall thickness
Steel, cast iron	0.75 ( $D - F_w$ ) and over
Light metal alloy	1.5 ( $D - F_w$ ) and over

## Shaft and housing requirements

Table 3 shows the shaft and housing requirements.

Table 3 Shaft and housing requirements (recommended)

Characteristics	Shaft		Housing	
	Type HF	Type HFL	Type HF	Type HFL
Roundness (max)	IT3 (IT4)		IT4 (IT5)	
Cylindricity (max)	IT3 (IT4)		IT4 (IT5)	
Surface roughness	0.2a		1.6a	
Surface hardness	HRC58~64		—	
Effective hardened layer depth (min)	0.4mm		—	

## Lubrication

Oil lubrication is optimum for these one-way clutches, but generally grease lubrication is mostly applied to this type of one-way clutch. NTN one-way clutches are filled up with a suitable grease. These clutches need no further grease replenishment, but subject to general applications.

In replenishing, good care must be exercised of too much grease filling. Too much filling could cause interference with smooth clutching.

## Allowable operating temperature

For Type HF and HFL ··· Oil lubrication : -10 to 120°C  
Grease lubrication : -10 to 70°C

However, consult with NTN for application under temperature exceeding the said temperature range.

## How to mount

It is convenient to use a press-fitting mandrel as illustrated in Fig. 3 for assembling and mounting these one-way clutches. In that case, press-fit the outer ring, with its stamped mark side kept in contact with the mandrel shoulder.

**In assembling, be careful to prevent the outer ring from twisting. Avoid to hammer directly the outer ring and, in press-fitting, bring a proper jig in contact with the outer ring side face without fail. Furthermore, when press-fitting in an housing with shoulder, good care must be exercised to prevent the bearing side face from coming into contact with the housing shoulder and to thereby avoid deformation of the bearing.**

Also, shaft can be easily assembled by turning it in clutch idling direction. Where impossible to do so, provide the shaft end with a tapered (chamfered) guide to facilitate assembling-in.

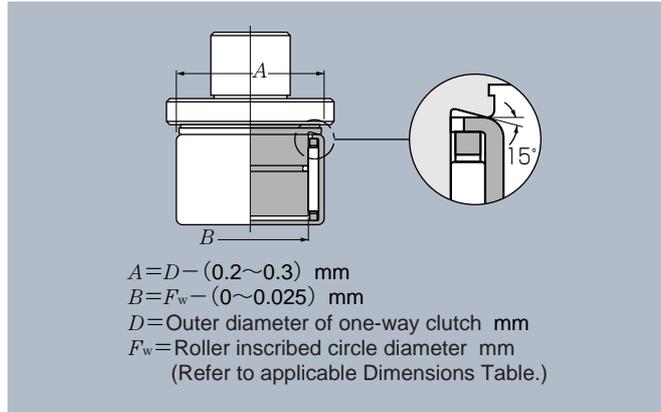

Fig. 3

## Precautions in selecting

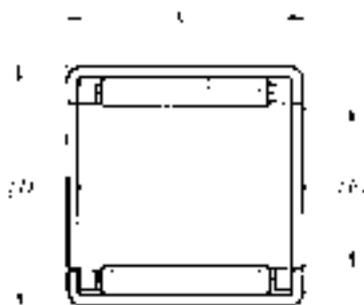

NTN makes it a rule to conduct functional verification tests on its manufactured one-way clutches under various test conditions. However, be noted that the clutch lifetime could reduce depending on the following factors; application to high load torque, high oscillation cycle and fine oscillation, etc., large radial load acting on one-way clutch unit, and use of a shaft with lower hardness.

Furthermore, lock failure could occur in the cases of fast idling speed, frequent use in idling, and application incurring vibration.

When using these one-way clutches under the special conditions stated above, feel free to contact NTN for further instructions.

**When it is forecast that clutching function failure of one-way clutch(ex. clutch slip in engaging) could result in serious damage to person or equipment, appropriate safety devices must be provided separately.**

## Bottom Roller Bearings for Textile Machinery

These bottom roller bearings for textile machinery are grease-prefilled needle roller bearings intended to support the bottom rollers (fluted rollers) of a fine spinning machine, a roving frame or a drawing frame. **Type FRIS** is applied to a fine spinning machine and a roving frame, and **Type FR** applied to a drawing frame.

### Types and construction

Bottom roller bearing **FRIS** is used to support the bottom rollers of a fine spinning machine and a roving frame. The outer ring outer profile of this bearing type is spherical, which can allow, to some extent, mounting error in the bottom rollers. On the other hand, the inner ring is provided with a rib at its both ends and a clearance between the outer ring and each inner ring rib is minimized. Furthermore, the rib outer surface is knurled to prevent invasion of cotton pieces into the bearing.

These bottom roller bearings are classified into internationally interchangeable **A-series** bearings with bearing fixing saddle (to fix a bearing to a support stand) and **B-series** bearings adaptable to the dimensions of JIS Fluted Rollers.

**A-series** bearings are further classified into one bearing type (bearing number + tail code **SA**) wherein inner ring and outer ring are separable from one another according to saddle type and another bearing type (bearing number + tail code **SB**) wherein inner ring and outer ring are non-separable. Of course, these bearings can also be supplied without saddle.

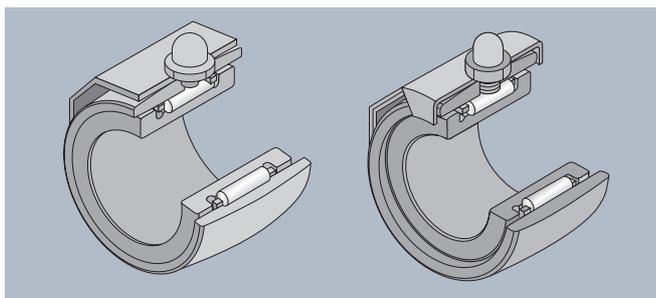

Fig. 1 Type FRIS · SA

Fig. 2 Type FRIS · SB

On the other hand, **B-series** bearings are further classified into bearing type with grease nipple (bearing number + tail code **N**), bearing type with knock pin on its outer ring (bearing number + tail code **P**) and bearing type with knock hole on its outer ring (bearing number +

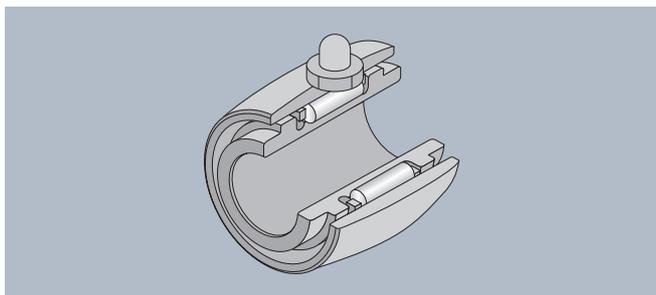

Fig.3 Type FRIS

**W**) (latter two types—classified by the fixing method applied).

These bearings can be supplied with saddle thereon on request, similarly to A-series.

Type **FR** is used to support the rollers of a drawing frame. This bearing type is composed of two drawn cup type needle roller bearings which are configured in a housing. These have no inner ring and use a shaft as the direct raceway surface. Synthetic rubber seal is fitted in the both ends of the housing. This bearing type is fixed to a support stand with knock pins press-fitted in the housing. The knock pin is provided with an grease hole to enable grease replenishing.

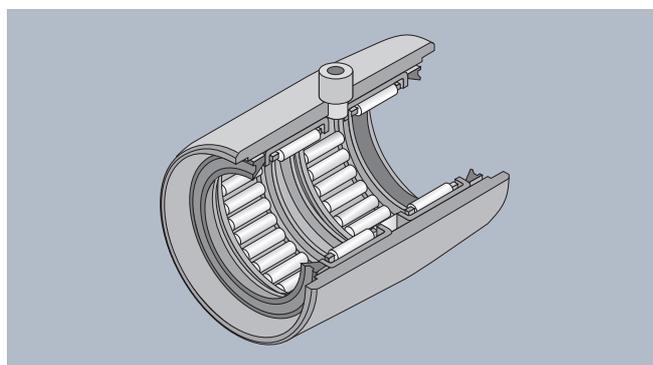

Fig. 4 Type FR

### Nominal bearing number

Nominal bearing number comprises type code, dimension code [shaft dia. ( $d$  or  $F_w$ )] and tail code.

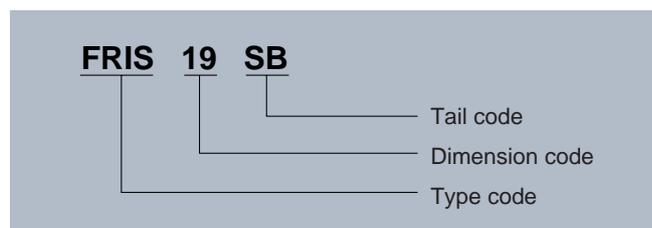

Fig.5

## Tensioner Pulleys for Textile Machinery

These pulleys are used to guide and tension the tapes and belts driving the spindles of a fine spinning machine, a roving frame, a false twister, etc.

A pulley drawn precisely from steel plate by precision deep drawing is press-fitted in the outer ring of shaft bearing in place of inner ring.

### Types and construction

Single-row or double-row ball bearing is built in this pulley, which is internally pre-filled with lithium soap base grease. Grease is replenished through a grease hole which is internally provided in the stud. Two different mounting methods are available as follows for these pulleys; one method is to bolt a pulley to the roller carrier of machine with holder bolt using a special-purposed holder (Type code: **JF** · **S**) and another method is to bolt directly a pulley to machine frame using the bolting hole drilled in the stud and a corresponding hexagon head bolt. A knock pin press-fitted in the stud end face is to lock the bolt after tightened.

When a pulley is directly bolted to machine frame, provide the hexagon head bolt center with a grease through-hole for grease replenishing and screw a grease nipple in its end face.

In mounting a double-row ball bearing type tension pulley, insert the stud directly into machine frame and tighten it with nut, without using the special-purposed holder. Replenish grease using the box nut.

### Composition of nominal number

Nominal number comprises type code (**JPU** · **S**), dimension code (Pulley outer dia. (*D*)) and tail code. Tension pulley with special-purposed holder is represented by nominal number + tail code (holder nominal number).

(How to read this table)

For example, for conversion from 38°C to °F read 38 in 4th row box (10th line from the top) and then read the right-side °F box. 38°C is equivalent to 100.4°F upon reading. Furthermore, for conversion from 38°F to °C read the left-side °C box.

°F38 is equivalent to 3.3°C upon reading.

$$C = 5/9(F - 32)$$

$$F = 9/5C + 32$$

Approximate conversion values against Vickers hardness of steel materials

[How to read the table]

For example, for conversion from 10kgf to N read 10 on center stage of 1st row box and then read the right-side N. 10kgf is equivalent to 98.066 upon reading. Furthermore, for conversion from 10N to kgf read the right side kgf box. 10N is equivalent to 1.0197kg upon reading.

1kgf=9.80665N  
1N=0.101972kgf

**Ordinary tolerance for cutting dimensions**

JIS B 0405

Ordinary tolerance is applied to cutting dimensions for which special accuracy is not required functionally and, therefore, applicable tolerances are indicated in batch, without individual indication of them, in relevant specification, drawings, etc.

Ordinary tolerances shall be indicated by either one of the following methods (1) and (2).

- (1) Numerical value table for each dimensional division
- (2) Applicable Standard No. and tolerance class

Ex. Ordinary tolerance shall conform to the "Medium Class" specified in JIS B 0405.

Unit : mm

Dimensional division	Class	Tolerance				
		Fine class (Class-12)	Medium class (Class-14)	Coarse class (Class-16)		
0.5 and over 3 incl. Over 3 6 incl.		±0.05	±0.1	—		
				±0.2		
Over 6 30 incl. Over 30 120 incl. Over 120 315 incl.		±0.1	±0.2	±0.5		
				±0.15	±0.3	±0.8
				±0.2	±0.5	±1.2
Over 315 1000 incl. Over 1000 2000 incl.		±0.3	±0.8	±2		
				±0.5	±1.2	±3

Reference: The numerical values given above every each of "Fine Class", "Medium class" and "Coarse Class" match "Fine series, Medium series", and Coarse series" specified in ISO 2768 (Permissible Machining Variations in Dimensions without Tolerance

**Ordinary tolerances for castings**

JIS B 0407

This Standard specifies the ordinary tolerances for the as-casted length and wall thickness dimensions (hereinafter referred to as "ordinary tolerance") of gray castings and spherical graphite

castings molded using sand molds (excluding precision mold and other equivalent).

The ordinary tolerance shall be indicated by either one of the following methods (1) and (2).

- (1) Numerical value table for each dimensional division
- (2) Applicable Standard No. and tolerance class

Ex. JIS B 0407, Coarse class

Ordinary tolerance for length

Unit : mm

Dimensional division	Material Class	Gray castings		Spherical graphite castings	
		Fine class	Coarse class	Fine class	Coarse class
120 incl.		±1	± 1.5	±1.5	± 2
Over 120 250 incl.		±1.5	± 2	±2	± 2.5
Over 250 400 incl.		±2	± 3	±2.5	± 3.5
Over 400 800 incl.		±3	± 4	±4	± 5
Over 800 1600 incl.		±4	± 6	±5	± 7
Over 1600 3150 incl.		—	±10	—	±10

Ordinary tolerance for wall thickness

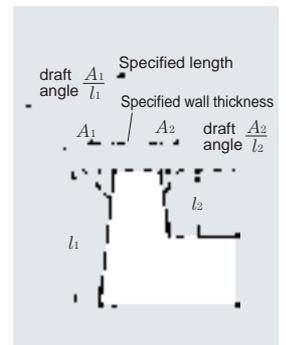

Unit : mm

Dimensional division	Material Class	Gray castings		Spherical graphite castings	
		Fine class	Coarse class	Fine class	Coarse class
10 incl.		±1	±1.5	±1.2	±2
Over 10 18 incl.		±1.5	±2	±1.5	±2.5
Over 18 30 incl.		±2	±3	±2	±3
Over 30 50 incl.		±2	±3.5	±2.5	±4

Dimension-A for draft angle

Unit : mm

Dimensional division $l$	Dimension A (max)
18 incl.	1
Over 18 30 incl.	1.5
Over 30 50 incl.	2
Over 50 120 incl.	2.5
Over 120 315 incl.	3.5
Over 315 630 incl.	6
Over 630 1000 incl.	9

Remarks :  $l$  means  $l_1$  and  $l_2$  in the above sketch.  
A means  $A_1, A_2$  in the above sketch.

**Ordinary tolerances for press-formed metal parts**

JIS B 0408

This Standard specifies the ordinary tolerances for the punching, bending and drawing dimensions, bending angle of press-formed metal parts (hereinafter referred to as "ordinary tolerance").

Ordinary tolerance is applied to the dimensions for which special accuracy is not required functionally and, therefore, applicable tolerances are indicated in batch, without individual indication of them, in relevant specification, drawings, etc.

Ordinary tolerance shall be indicated by either one of the following methods (1) and (2).

- (1) Numerical value table for each dimensional division
- (2) Applicable Standard No. and tolerance class

Ex. JIS B0408, Class-A

Ordinary tolerance for punching, bending and drawing dimensions

Unit : mm

Dimensional division	Class				
	Class-A	Class-B	Class-C	Class-D	Class-E
30 incl.	±0.1	±0.15	±0.25	±0.4	±0.6
Over 30 120 incl.	±0.15	±0.25	±0.45	±0.7	±1.1
Over 120 315 incl.	±0.2	±0.4	±0.6	±1	±1.6
Over 315 1000 incl.	±0.3	±0.7	±1.1	±1.8	±2.8
Over 1000 2000 incl.	±0.5	±1.1	±1.8	±3	±4.5

Ordinary tolerance for bending angle

Unit : degree

Type of bending	Class	
	Class B, C	Class D, E
Perpendicular bending	±1	±2
Other bending	±1.5	±3

Remarks: The ordinary tolerance for bending angle shall be applied to Class-A tolerance.

### Ordinary tolerance for die casts

JIS B 0409

This Standard specifies the ordinary tolerance for the as-casted dimensions of zinc alloy die casts and aluminum alloy die casts.

The ordinary tolerance shall be indicated by either one of the following methods (1) and (2).

- (1) Numerical value table for each dimensional division
- (2) Applicable standard No. Ex.:JIS B 0409

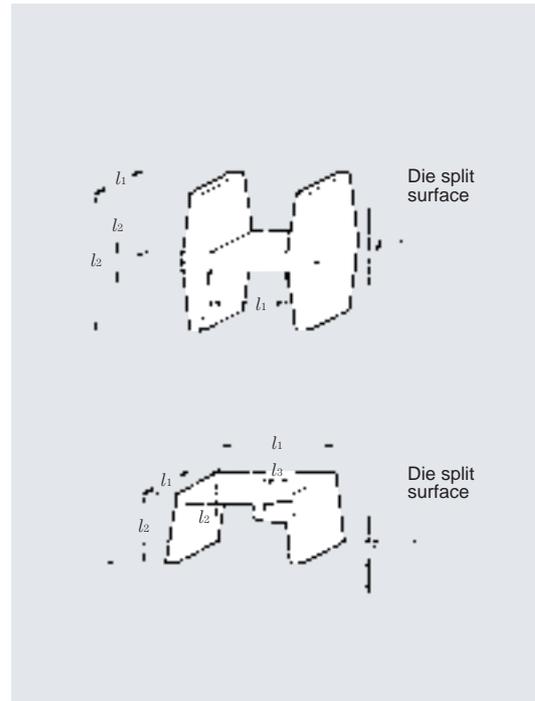

Ordinary tolerance for dimensions

Unit : mm

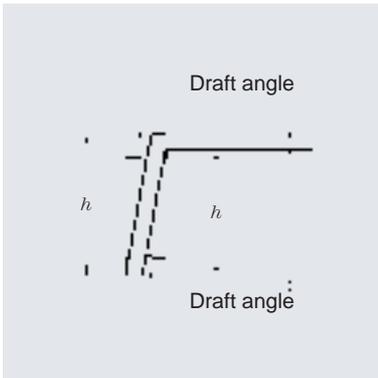

Dimensional division	Classification by application	Portions casted by solid die and movable die		Portions casted by movable core		
		Parallel to die split surface	Perpendicular to die split surface <sup>1)</sup> $l_2$		$l_2$	
			Projected area of castings perpendicular to die split surface <sup>2)</sup> $cm^2$		Projected area of casting portion perpendicular to moving direction of movable core $cm^2$	
			600 and below	over 600 2400 incl.	150 and below	over 150 600 incl.
30 incl.	±0.25	±0.5	±0.6	±0.5	±0.6	
Over 30 50 incl.	±0.3	±0.5	±0.6	±0.5	±0.6	
Over 50 80 incl.	±0.35	±0.6	±0.6	±0.6	±0.6	
Over 80 120 incl.	±0.45	±0.7	±0.7	±0.7	±0.7	
Over 120 180 incl.	±0.5	±0.8	±0.8	±0.8	±0.8	
Over 180 250 incl.	±0.55	±0.9	±0.9	±0.9	±0.9	
Over 250 315 incl.	±0.6	±1	±1	±1	±1	
Over 315 400 incl.	±0.7	—	—	—	—	
Over 400 500 incl.	±0.8	—	—	—	—	
Over 500 630 incl.	±0.9	—	—	—	—	
Over 630 800 incl.	±1	—	—	—	—	
Over 800 1000 incl.	±1.1	—	—	—	—	

Note 1) The dimensional tolerance for  $l_1$  shall be applied to partial dimension of die split surface which does not influence the length.

2) "Projected area of castings" means the circumference internal projected area of as-casted castings.

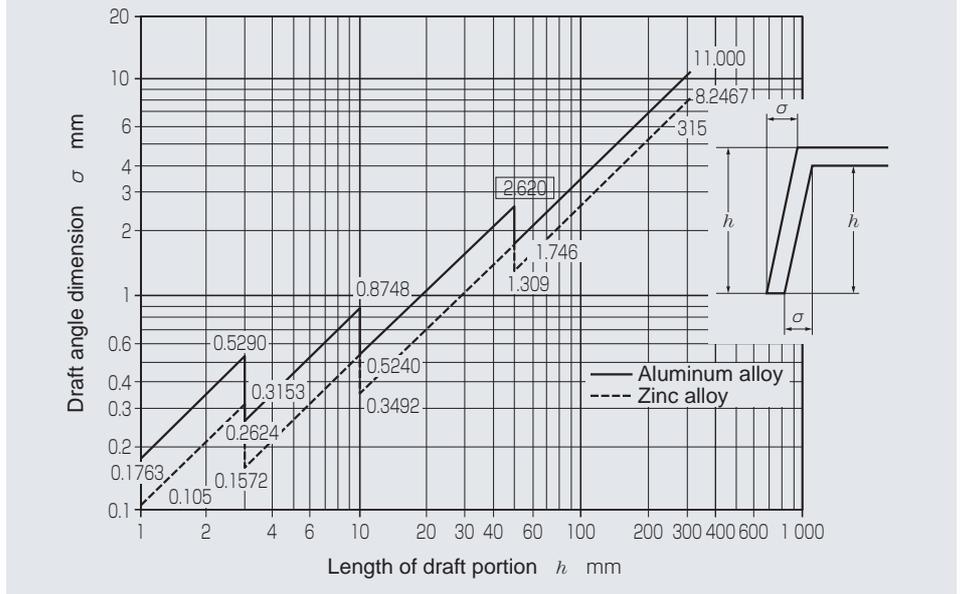

Maximum draft angle value

Unit : degree

Length of draft portion(mm)	Material	
	Aluminum alloy	Zinc alloy
3 and less	10	6
Over 3 - 10 incl.	5	3
Over 10 - 50 incl.	3	2
Over 50 - 315 incl.	2	1.5

Chart showing the relationship of drafted portion length ( $h$ ) vs draft angle dimension ( $\sigma$ )

Ordinary tolerances for sheared metal plates

JIS B 0410

This Standard specifies the ordinary tolerances for the shearing width and ordinary tolerances for the straightness and perpendicularity (hereinafter generically referred to as "ordinary tolerance") of metal plates of 12mm and less in thickness which were sheared by direct shearing machines such as gear pusher, square shear, etc.

The ordinary tolerance shall be indicated by either one of the following methods (1) and (2).

- (1) Numerical value table for each dimensional division
- (2) Applicable standard No. and tolerance class

Ex. 1. JIS B 0410, Class-B

- 2. Cutting width, straightness: JIS B 0410, Class-B
- Perpendicularity: JIS B 0410, Class-A

Definition of the terms: The terms used in this Standard are as defined in JIS B 0111 (Terminology relating to press machines) and, in addition, defined as follows.

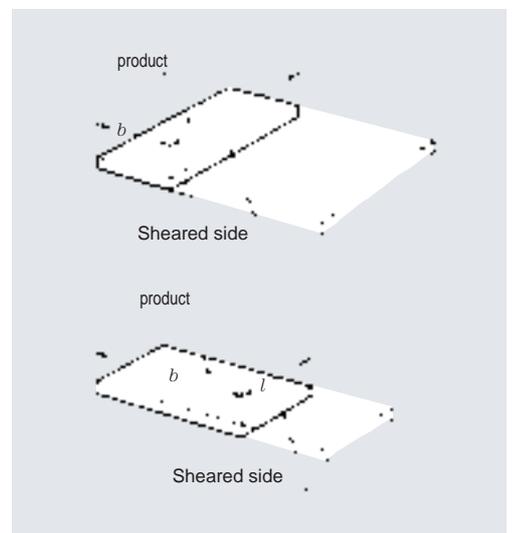

- (1) Cutting width: Distance from one side sheared by shear cutter to opposite side, as illustrated in Fig.  $b$
- (2) Cutting length: length of one side sheared by shear cutter, as illustrated in Fig.  $l$ .

Ordinary tolerance for shearing width

Unit : mm

Classification by plate thickness Cutting width division	1.6 and less		Over 1.6 3 incl.		Over 3 6 incl.		Over 6 12 incl.	
	Class-A	Class-B	Class-A	Class-B	Class-A	Class-B	Class-A	Class-B
120 and less	±0.2	±0.5	±0.3	±0.5	±0.7	±1.2	—	±1.6
Over 120 - 315 incl.	±0.3	±0.6	±0.4	±0.8	±0.9	±1.6	—	±2.0
Over 315 - 1000 incl.	±0.5	±1.0	±0.5	±1.2	±1.6	±2.0	—	±2.5
Over 1000 - 2000 incl.	±0.8	±1.2	±0.8	±1.6	±2.0	±3.0	—	±3.0
Over 2000 - 3150 incl.	±1.0	±1.4	±1.0	±1.6	±2.8	±3.0	—	±3.5

Remarks: non-applicable to cutting length exceeding 3150 mm.

Ordinary tolerance for straightness Unit : mm

Classification by plate thickness Cutting width division	1.6 and less		Over 1.6 3 incl.		Over 3 6 incl.	
	Class-A	Class-B	Class-A	Class-B	Class-A	Class-B
120 and less	0.2	0.3	0.2	0.3	0.5	0.8
Over 120 - 315 incl.	0.3	0.5	0.3	0.6	1.0	1.6
Over 315 - 1000 incl.	0.4	0.9	0.5	1.0	1.4	2.0
Over 1000 - 2000 incl.	0.6	1.2	0.8	1.6	2.5	3.0
Over 2000 - 3150 incl.	0.9	1.6	1.0	2.2	2.8	4.5

Remarks: Non-applicable to cutting width of less than 20 times as much as plate thickness or cutting width of less than 30mm.

Ordinary tolerance for straightness Unit : mm

Classification by plate thickness Cutting width division	3 and less		Over 3 6 incl.		Over 6 12 incl.	
	Class-A	Class-B	Class-A	Class-B	Class-A	Class-B
120 and less	0.3	0.5	0.5	1.0	—	1.6
Over 120 - 315 incl.	0.6	1.2	0.8	1.6	—	2.0
Over 315 - 1000 incl.	1.6	3.0	2.0	3.0	—	3.0
Over 1000 - 2000 incl.	3.0	6.0	4.0	6.0	—	6.0
Over 2000 - 3150 incl.	4.5	9.0	5.5	9.0	—	9.0

### Ordinary tolerance for sintered metal parts

JIS B 0411

This Standard specifies the ordinary tolerance which is applied to the machining dimensions of sintered mechanical parts and sintered oil-contained bearing, of sintered metal parts, but excluding machining methods other (e.g. cutting, etc.) than the machining method specific for sintered metal parts.

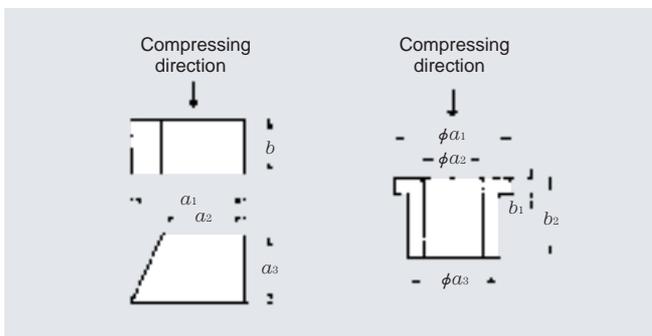

Ordinary tolerance is applied to the dimensions for which special accuracy is not required functionally and, therefore, applicable tolerances are indicated in batch, without individual indication of them, in relevant specification, drawings, etc.

Ordinary tolerance shall be indicated by either one of the following methods (1) and (2).

- (1) Numerical value table for each dimensional division
- (2) Applicable Standard No. and tolerance class  
Ex. JIS B0411, Fine Class

Definition of terms: The terms used in this Standard are as defined below.

- (1) Width: Perpendicular dimension against compressing direction in compressive molding of powders, as illustrated in Fig. *a*.
- (2) Height: Dimension parallel to compressing direction in molding of powders, as illustrated in Fig. *b*.

Class: The ordinary tolerance class shall be three classes of "Fine Class", "Medium Class" and "Coarse class".

Reference: The numerical values every each class of "Fine Class", "Medium Class" and "Coarse class" match "Fine Series, Medium Series and Coarse Series specified in ISO 2768 (Permissible machining variations in dimensions without tolerance indication)

Ordinary tolerance for width Unit : mm

Dimensional division	class		
	Fine class	Medium class	Coarse class
6 and less	±0.05	±0.1	±0.2
Over 6 - 30 incl.	±0.1	±0.2	±0.5
Over 30 - 120 incl.	±0.15	±0.3	±0.8
Over 120 - 315 incl.	±0.2	±0.5	±1.2

Ordinary tolerance for height Unit : mm

Dimensional division	class		
	Fine class	Medium class	Coarse class
6 and less	±0.1	±0.2	±0.6
Over 6 - 30 incl.	±0.2	±0.5	±1
Over 30 - 120 incl.	±0.3	±0.8	±1.8

**Ordinary tolerance for steel castings**

JIS B 0412

This Standard specifies the ordinary tolerances for the length and as-casted wall thickness (hereinafter referred to as "ordinary tolerance") of steel castings casted by sand molds.

Ordinary tolerance shall be indicated by either one of the following methods (1) and (2).

- (1) Numerical value table for each dimensional division
  - (2) Applicable Standard No. and tolerance class
- Ex. JIS B0412, Medium Class

Tolerance class: The ordinary tolerance class shall be three classes of "Fine Class", "Medium Class" and "Coarse Class".

Ordinary tolerance for length

Unit : mm

Dimensional division \ class	Fine class	Medium class	Coarse class
120 and less	±1.8	± 2.8	± 4.5
Over 120 - 315 incl.	±2.5	± 4	± 6
Over 315 - 630 incl.	±3.5	± 5.5	± 9
Over 630 - 1250 incl.	±5	± 8	±12
Over 1250 - 2500 incl.	±9	±14	±22
Over 2500 - 5000 incl.	—	±20	±35
Over 5000 - 10000 incl.	—	—	±63

Ordinary tolerance for wall thickness

Unit : mm

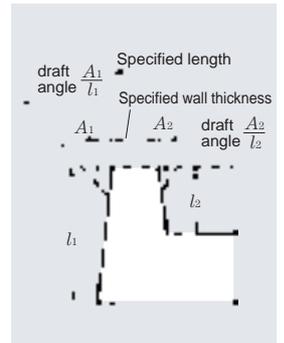

Dimensional division \ class	Fine class	Medium class	Coarse class
18 and less	±1.4	±2.2	± 3.5
Over 18 - 50 incl.	±2	±3	± 5
Over 50 - 120 incl.	—	±4.5	± 7
Over 120 - 250 incl.	—	±5.5	± 9
Over 250 - 400 incl.	—	±7	±11
Over 400 - 630 incl.	—	±9	±14
Over 630 - 1000 incl.	—	—	±18

Remarks: "Fine Class" shall be applied to minor steel castings subjected to special accuracy.

Dimension-A for draft angle

Unit : mm

Dimensional division <i>l</i>	Dimension A (max)
18 incl.	1.4
Over 18 50 incl.	2
Over 50 120 incl.	2.8
Over 120 250 incl.	3.5
Over 250 400 incl.	4.5
Over 400 630 incl.	5.5
Over 630 1000 incl.	7

Remarks: *l* means *l*<sub>1</sub> and *l*<sub>2</sub> in the above sketch.  
*A* means *A*<sub>1</sub>, *A*<sub>2</sub> in the above sketch.

**Ordinary tolerance for aluminum alloy castings**

JIS B 0414

This Standard specifies the ordinary tolerances (hereinafter referred to as "ordinary tolerance") for the length and wall thickness of aluminum alloy castings (hereinafter referred to as "castings" molded by sand mold and mold. However, this Standard is not applied to castings molded by precision molds using "Lost Wax Method", etc.

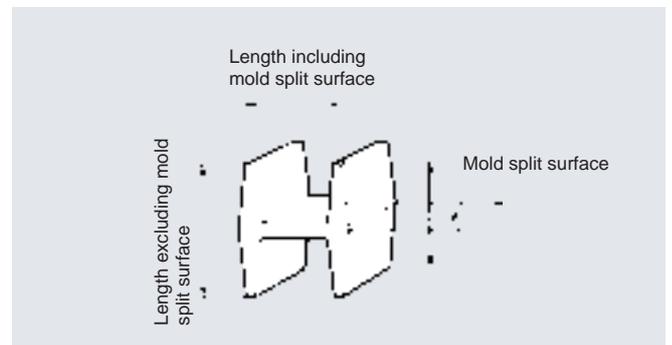

Ordinary tolerance shall be indicated by either one of the following methods (1) and (2).

- (1) Numerical value table for each dimensional division
- (2) Applicable Standard No. , classification and tolerance class by casting mold

Ex. JIS 0414 , Sand mold, Coarse Class

Definition of terms: The terms used in this Standard are as defined below.

Mold split surface: Two or more splitted surfaces of mold for drafting a model or a castings out of a casting mold.

Ordinary tolerance for length

Unit : mm

Type	Dimensional division	50 incl.		Over 50 120 incl.		Over 120 250 incl.		Over 250 400 incl.		Over 400 800 incl.		Over 800 1600 incl.		Over 1600 3150 incl.		(Ref.) <sup>1)</sup> Correspond to standard tolerance grade
